BUILDING CODE
BUILDING AND CONSTRUCTION
Foreword

The Ghana Standards Authority is the National Statutory Body responsible for the development and promulgation of Ghana Standards.

The Ghana Standards Authority is a member of the African Organization for Standardization (ARSO), the International Organization for Standardization (ISO) and an affiliate member of the International Electrotechnical Commission (IEC).

This Ghana Building Code (GhBC) GS 1207:2018 is a modified adoption of the International Building Code. It lays down the essential requirements that buildings must conform.

The Committee responsible for the adoption of this Code is the National Technical Committee on Ghana Building Code.

This is the 1st edition.

Users of this Code should note that the Code undergoes revision from time to time and any references to it statutorily imply its latest edition.
PREFACE

INTRODUCTION
The Ghana Building Code (GhBC) establishes minimum requirements for buildings using prescriptive and performance-related provisions. It is founded on broad-based principles that make possible the use of new materials and new building designs.

The Code is to ensure uniformity of standards for the regulation and compliance of stakeholders in the building construction industry in terms of public health, general safety, fire protection, structural efficiency and integrity, and environmental integrity and sustainability.

DEVELOPMENT
Historically, Building Regulations have been in use by various Municipal Administrations in Ghana from about the 1940s; and in 1960, the then West African Building Research Institute (WABRI) published, a Part III of a Code dealing with ‘Loads’ to be used in Civil Engineering Structures.

By the early 1970s the Code and Building Regulations that were hitherto in use were evidently out of date and the Building and Road Research Institute (BRRI) of the Council for Scientific and Industrial Research (CSIR) decided to produce a draft Building Code for discussion, modification and use as a basis for a final Building Code to address the redundancy of the earlier documents.

Further development by BRRI resulted in Parts 3 (Structural Loads & Procedures) and 4 (Foundations) of the Draft Code which was published in 1977. This was followed by the Parts 1 (Administration), 2 (Use & Occupancy) and 5 (Housing & Small Buildings) by 1988.

With changes in land use patterns, materials and construction methods and local government structure, the Ministry of Works and Housing had produced the National Building Regulations in 1996 which was gazetted as LI 1630 (1996).

Between 2011 and 2012, a Draft Ghana Building Code (2012) was compiled based on the BRRI Draft Building Code of 1988 under the auspices of the Ministry of Water Resources, Works and Housing (MWRWH) with funding from the UNDP, through the National Disaster Management Organization (NADMO).

This current Code which is the first comprehensive Building Code for Ghana, was undertaken by the Ghana Standards Authority (GSA), for and on the behalf of the Ministry of Works & Housing (MWH) with financial assistance by the Swiss Government through the International Finance Corporation / World Bank Group, Ghana Office (IFC/WBG).
MAINTENANCE

This Building Code will be kept up to date through the review of proposed changes that will be submitted by code enforcement officials, industry representatives, design professionals, government officials and other stakeholders.

The GSA will receive and compile comments from stakeholders yearly for review by a Code Review Committee. Proposed changes will be carefully considered through an open code development process in which all stakeholders may participate.

A new edition of this Code will be promulgated every 4 years.

The Code Development Process reflects principles of openness, transparency, balance, due process and consensus, as embodied in GS 1012 - Principles for Standardization and Procedures for Technical Work, which governs the Ghana Standard Development process.

ACKNOWLEDGEMENT

The development of this Code was undertaken by the Ghana Standards Authority (GSA), for and on behalf of the Ministry of Works & Housing (MWH). The support of the Swiss Government through the International Finance Corporation / World Bank Group, Ghana Office (IFC/WBG) is hereby appreciated and acknowledged.

Between 2011 and 2012, a Draft Ghana Building Code (2012) was compiled based on the BRRI Draft Building Code of 1988 under the auspices of the Ministry of Water Resources, Works and Housing (MWRWH) with funding from the UNDP, through the National Disaster Management Organization (NADMO). Ing. K. A. Solomon-Ayeh (then of the BRRI) was the special Consultant for the 2012 Draft Code.

The continuous support of the Ministry of Trade and Industry is acknowledged.

Ing. John A. Tettey of the Ministry of Works and Housing and his team are acknowledged for the 2012 Draft Code.

Dr. Ebenezer A. Tackie of the KNUST and his team are acknowledged for the final report of the Ghana Building Code 1989.

Dr. K. Amonoo-Neizer of the BRRI is acknowledged for the contribution to the 1977 and 1988 Draft Codes.

4.2.8.3 Number of means of escape.

4.2.8.4 Arrangements of means of escape.

4.2.8.4.1 Anchor building means of escape.

4.2.8.5 Distance to exits.

4.2.8.6 Access to exits.

4.2.8.6.1 Exit passageways.

4.2.8.7 Service areas fronting on exit passageways.

4.2.8.8 Security grilles and doors.

4.3 HIGH-RISE BUILDINGS.

4.3.1 Applicability.

4.3.2 Construction.

4.3.2.1 Reduction in fire-resistance rating.

4.3.2.1.1 Type of construction.

4.3.2.1.2 Shaft enclosures.

4.3.2.2 Seismic considerations.

4.3.2.3 Structural integrity of interior exit stairways and elevator hoistway enclosures.

4.3.2.3.1 Wall assembly.

4.3.2.3.2 Wall assembly materials.

4.3.2.3.3 Concrete and masonry walls.

4.3.2.3.4 Other wall assemblies.

4.3.2.4 Sprayed fire-resistant materials (SFRM).

4.3.3 Automatic sprinkler system.

4.3.3.1 Number of sprinkler risers and system design.

4.3.3.1.1 Riser location.

4.3.3.2 Water supply to required fire pumps.

4.3.3.3 Secondary water supply.

4.3.3.4 Fire pump room.

4.3.4 Emergency systems.

4.3.4.1 Smoke detection.

4.3.4.2 Fire alarm system.

4.3.4.3 Fire hydrant system.

4.3.4.4 Emergency voice/alarm communication system.

4.3.4.5 Emergency responder radio coverage.

4.3.4.6 Fire command.

4.3.4.7 Smoke removal.

4.3.4.8 Standby and emergency power.

4.3.4.8.1 Equipment room.

4.3.4.8.2 Fuel line piping protection.

4.3.4.8.3 Standby power loads.

4.3.4.8.4 Emergency power loads.

4.3.5 Means of escape and evacuation.

4.3.5.1 Remoteness of interior exit stairways.

4.3.5.2 Additional interior exit stairway.

4.3.5.3 Stairway door operation.

4.3.5.3.1 Stairway communication system.

4.3.5.4 Smokeproof enclosures.

4.3.5.5 Luminous escape path markings.

4.3.5.6 Emergency escape and rescue.

4.3.6 Elevators.

4.3.6.1 Fire service access elevator.

4.3.6.2 Occupant evacuation elevators.

4.4 ATRIUMS.

4.4.1 General.

4.4.2 Use.

4.4.3 Automatic sprinkler protection.

4.4.4 Fire alarm system.

4.4.5 Smoke control.

4.4.6 Enclosure of atriums.

4.4.7 Standby power.

4.4.8 Interior finish.

4.4.9 Exit access travel distance.

4.27.2.3 Gas cabinets. .................................................................................. 134
5.6.4 Exemption to Open Air Space

5.6.2.6 Joint Open Air Space

5.6.2.4 The front open space would govern the height of the building (see 6.5.4).

5.6.2.1.3 Side Open Space

5.6.2.1 Exterior open Spaces

5.5 REQUIREMENTS OF PLOTS

5.5.7.1 Residential

5.5.7.2 Industrial

5.5.7.3 Other Land uses

5.5.7.3.1 Assembly Halls/Cinema Theatres

5.5.7.3.2 Fuel/Gas filling Station

5.6 OPEN SPACES (WITHIN A PLOT)

5.6.1 General

5.6.1.2 Open spaces separate for each building of wing –

5.6.2 Residential Buildings

5.6.2.1 Exterior open Spaces

5.6.2.1.1 Front Open Space

5.6.2.1.2 Rear Open Space

5.6.2.1.3 Side Open Space

5.6.2.3.2 For tower-like structures, as an alternative to 5.6.2.3., open spaces shall be as below:

5.6.2.4 The front open space would govern the height of the building (see 6.5.4)

5.6.2.5 Interior Open Spaces

5.6.2.6 Joint Open Air Space –

5.6.3 Other Occupancies

5.6.3.1 Open spaces for other occupancies shall be as below:

5.6.4 Exemption to Open Spaces

5.6.4.1 Projections into Open Spaces –

PART 5: SITE DEVELOPMENT AND LAND USE

5.1 GENERAL

5.2 LAND USE CLASSIFICATION AND USES PERMITTED

5.3 MEANS OF ACCESS

5.3.1 Every building/plot shall abut on a public/private means of access like streets/roads duly formed.

5.3.2 - Pathways

5.3.3 Width of Means of Access

5.3.3.1 Other Buildings

5.3.5 Access from Highways/Important Roads

5.3.6 For high rise buildings and buildings other than residential, the following additional provisions of means of access shall be ensured:

5.4 COMMUNITY OPEN/SOCIAL SPACES AND AMENITIES

5.4.1 Residential and Commercial Zones

5.4.4 Industrial Zones

5.4.5 Other Amenities

5.4.6 Underground cisterns for water storage

5.4.7 Size of Plots

5.5 REQUIREMENTS OF PLOTS

5.5.1 Uses as Specifically Designated on Development Plan

5.5.2.1.2 Uses to be in Conformity with the Zone

5.5.2.1.3 Uses

5.5.3.1 Residential

5.5.3.2 - Pathways

5.5.4 Distance from Electric Lines

5.5.5 Distance from Electric Lines

5.5.6 InterClause of Roads

5.5.7.1 Residential

5.5.7.2 Industrial

5.5.7.3 Other Land uses

5.5.7.3.1 Assembly Halls/Cinema Theatres

5.5.7.3.2 Fuel/Gas filling Station

5.6 OPEN SPACES (WITHIN A PLOT)

5.6.1 General

5.6.1.2 Open spaces separate for each building of wing –

5.6.2 Residential Buildings

5.6.2.1 Exterior open Spaces

5.6.2.1.1 Front Open Space

5.6.2.1.2 Rear Open Space

5.6.2.1.3 Side Open Space

5.6.2.3.2 For tower-like structures, as an alternative to 5.6.2.3., open spaces shall be as below:

5.6.2.4 The front open space would govern the height of the building (see 6.5.4)

5.6.2.5 Interior Open Spaces

5.6.2.6 Joint Open Air Space –

5.6.3 Other Occupancies

5.6.3.1 Open spaces for other occupancies shall be as below:

5.6.4 Exemption to Open Spaces

5.6.4.1 Projections into Open Spaces –

5.6.5.1 Uses to be in Conformity with the Zone

5.6.5.2.1 Uses

5.6.5.3 Other Land uses

5.6.5.3.1 Assembly Halls/Cinema Theatres

5.6.5.3.2 Fuel/Gas filling Station

5.7 OPEN SPACES (WITHIN A PLOT)

5.7.1 Residential

5.7.2 Industrial

5.7.3 Other Land uses

5.7.3.1 Assembly Halls/Cinema Theatres

5.7.3.2 Fuel/Gas filling Station

5.8 OPEN SPACES (WITHIN A PLOT)

5.8.1 General

5.8.1.2 Open spaces separate for each building of wing –

5.8.2 Residential Buildings

5.8.2.1 Exterior open Spaces

5.8.2.1.1 Front Open Space

5.8.2.1.2 Rear Open Space

5.8.2.1.3 Side Open Space

5.8.2.3.2 For tower-like structures, as an alternative to 5.8.2.3., open spaces shall be as below:

5.8.2.4 The front open space would govern the height of the building (see 6.5.4)

5.8.2.5 Interior Open Spaces

5.8.2.6 Joint Open Air Space –

5.8.3 Other Occupancies

5.8.3.1 Open spaces for other occupancies shall be as below:

5.8.4 Exemption to Open Spaces

5.8.4.1 Projections into Open Spaces –
5.13.2 Vegetation and soil protection.

5.13.1.6 Documentation.

5.13.1.4.2 Restoration.

5.13.1.4 Soil reuse and restoration.

5.12.2.3 Signage.

5.12.2.2 Recirculation.

5.12.1.1 Water for outdoor landscape irrigation.

5.11.1.2 Adjoining plots and property.

5.11.1.1 Increased runoff.

5.11.1 Stormwater management.

5.11.1.1 Increased runoff.

5.11.1.2 Adjoining plots and property.

5.11.1.3 Brownfields.

5.11.2 Coal tar sealants.

5.12 LANDSCAPE IRRIGATION AND OUTDOOR FOUNTAINS

5.12.1 Landscape irrigation systems.

5.12.1.1 Water for outdoor landscape irrigation.

5.12.1.2 Irrigation system design and installation.

5.12.2.1 Treatment.

5.12.2.2 Recirculation.

5.12.2.3 Signage.

5.12.3 Signage.

5.11 STORMWATER MANAGEMENT

5.10.7 Greenfield sites.

5.10.6 Agricultural land.

5.10.5 Conservation area.

5.10.4 Wetland protection.

5.10.3 Surface water protection.

5.10.2.3 Development in flood hazard areas.

5.10.2.2 Flood hazard area preservation, specific.

5.10.2.1 Flood hazard area preservation, general.

5.10.2 Flood hazard areas.

5.10.1 PRESERVATION OF NATURAL RESOURCES

5.10.7.1 Site disturbance limits on greenfield sites.

5.10.7 Greenfield sites.

5.10.6 Agricultural land.

5.10.5 Conservation area.

5.10.4 Wetland protection.

5.10.3 Surface water protection.

5.10.2.3 Development in flood hazard areas.

5.10.2.2 Flood hazard area preservation, specific.

5.10.2.1 Flood hazard area preservation, general.

5.10.2 Flood hazard areas.

5.10.1 PRESERVATION OF NATURAL RESOURCES

5.9 PREDESIGN SITE INVENTORY AND ASSESSMENT.

5.8 GREENBELTS AND LANDSCAPING

5.8.1 General.

APPENDIX B

OFF-STREET PARKING SPACES

APPENDIX D

D-2 PLANNING

D-2.1 Type of Development – The type of development for low income housing shall be plotted development as row housing/flatted development as row housing/block development as group housing.

D-2.2 Density – The maximum density, in dwelling units/hectare, shall be as given in Table 4.9.

D-2.3 Size of Plot/Plinth Area – The minimum plot size shall be as follows, with coverage not exceeding 75 percent.

The maximum density, in dwelling units/hectare, shall be as given in Table 4.9.
5.13.2.2 Invasive plant species .......................................................... 160
5.14 BUILDING SITE WASTE MANAGEMENT ..................................... 160
5.14.1 Building site waste management plan ........................................ 160
5.14.2 Construction waste ............................................................... 161
5.15 TRANSPORTATION IMPACT ....................................................... 161
5.15.1 Walkways and bicycle paths ..................................................... 161
5.15.2 Changing and shower facilities ................................................ 161
5.15.3 Bicycle parking and storage ..................................................... 161
5.15.3.1 Short-term bicycle parking .................................................. 163
5.15.3.2 Long-term bicycle parking ................................................... 163
5.15.7.4 Preferred vehicle parking ..................................................... 163
5.15.4.1 High-occupancy vehicle parking ........................................... 164
5.15.4.2 Low-emission, hybrid, and electric vehicle parking ................. 164
5.16 HEAT ISLAND MITIGATION ....................................................... 164
5.16.1 General ................................................................................. 164
5.16.2 Site hardscape ....................................................................... 164
5.16.2.1 Site hardscape materials ....................................................... 164
5.16.2.2 Shading by structures ........................................................... 164
5.16.2.3 Shading by trees .................................................................. 164
5.16.2.4 Pervious pavement and permeable unit pavement .................. 165
5.16.3 Roof surfaces ...................................................................... 165
5.16.3.1 Roof coverings—solar reflectance and thermal emittance ........ 165
TABLE 5.16.3.1 ............................................................................. 165
5.16.3.1.1 Roof products testing ......................................................... 165
5.16.3.1.2 Solar reflectance index ....................................................... 165
5.16.3.2 Vegetative roofs ................................................................. 166
5.17 SITE LIGHTING ........................................................................ 166
5.17.1 Light pollution control .............................................................. 166
5.17.1.1 Lighting pollution zones ....................................................... 167

TABLE 6.5.1 - Comparative Floor Area Ratios for Occupancies Facing one Public Street of at Least 9m Width

6.5.5 Restrictions in the vicinity of Aerodromes

Table 6.5.2 - Floor Area Ratio and Coverage for Group Housing

6.6 REQUIREMENTS OF PARTS OF BUILDINGS

6.6.1 Plinth

6.6.1.1 Main Buildings

6.6.1.2 Interior Courtyards

6.6.2 Habitable Rooms

6.6.2.1 Height

6.6.2.2 Size

6.6.3 Kitchen

6.6.3.1 Height

6.6.3.2 Size

6.6.3.3 Other Requirements

6.6.4 Bathrooms and Water-Closets

6.6.4.1 Height

6.6.4.2 Size

6.6.4.3 Other Requirements

6.6.5 Ledge or Loft

6.6.5.1 Height

6.6.5.2 Size

6.6.5.3 Loft

6.6.6 Mezzanine floor

6.6.6.1 Height

6.6.6.2 Size

6.6.6.3 Other Requirements

6.6.7 Store Room

6.6.7.1 Height

6.6.7.2 Size

6.6.8 Garage

6.6.8.1 Height

6.6.8.2 Size

6.6.9 Basement

6.6.9.3 The basement shall have the following requirements

6.6.10 Chimneys

6.6.11 Parapet

6.6.12 Cabin

6.6.13 Boundary Wall

6.6.13.1 The requirements of the boundary wall are given below:

6.6.14 Wells

6.6.14.1 Location

6.6.14.2 Requirements

6.6.15 Septic Tanks

6.6.15.1 Location of Septic Tanks and Subsurface Absorption Systems

6.6.15.2 Requirements

6.6.16 Office-cum-Letter Box Room

6.6.16.1 Business Building

6.6.17 Meter Rooms

6.6.18 Staircase

6.6.18.1.1 Minimum Width

6.6.18.1.2 Minimum Tread

6.6.18.1.3 Maximum Riser

6.6.18.2 Minimum headroom

6.6.19 Roofs

6.6.21 Special requirements for the physically handicapped

6.7 RODENT-PROOFING AND TERMITE-PROOFING OF BUILDINGS

APPENDIX A

A-0 GENERAL

A-0.1.1 Aerodrome Reference Point (ARP)
A-0.1.2 Approach Funnel

A-0.1.3 Elevation or Reduced Level

A-0.1.4 Transitional Area

A-1 PROHIBITED AREA

A-1.2 For the Aerodromes listed by the Ghana Civil Aviation Authority

A-2 HEIGHT RESTRICTION

A-2.1 For the aerodromes listed by the Ghana Civil Aviation Authority

Table 4.5 - Height Restriction with respect to Approach Funnels

A-3 AERODROMES

6.8 MEZZANINES AND EQUIPMENT PLATFORMS

6.8.1 General

6.8.2 Mezzanines

6.8.2.1 Area limitation

6.8.2.1.1 Aggregate area of mezzanines and equipment platforms

6.8.2.2 Means of escape

6.8.2.3 Openness

6.8.3 Equipment platforms

6.8.3.1 Area limitation

6.8.3.2 Automatic sprinkler system

6.8.3.3 Guards

6.9 BUILDING AREA

6.9.1 General

6.9.1.1 Unlimited area buildings

6.9.1.2 Special provisions

6.9.1.3 Basements

6.9.2 Allowable area determination

TABLE 6.9.2

6.9.2.1 Single-occupancy, one-storey buildings

6.9.2.2 Mixed-occupancy, one-storey buildings

6.9.2.2.1 Group H-2 or H-3 mixed occupancies

6.9.2.3 Single-occupancy, multistorey buildings

6.9.2.4 Mixed-occupancy, multistorey buildings

6.9.2.4.1 Group H-2 or H-3 mixed occupancies

6.9.3 Frontage increase

6.9.3.1 Minimum percentage of perimeter

6.9.3.2 Minimum frontage distance

6.9.3.3 Amount of increase

6.10 UNLIMITED AREA BUILDINGS

6.10.1 General

6.10.1.1 Accessory occupancies

6.10.2 Measurement of open spaces

6.10.2.1 Reduced open space

6.10.3 Nonsprinklered, one-storey buildings

6.10.4 Sprinklered, one-storey buildings

6.10.4.1 Mixed occupancy buildings with Groups A-1 and A-2

6.10.5 Two-storey buildings

6.10.6 Group A-3 buildings of Type II construction

6.10.7 Group A-3 buildings of Type III and IV construction

6.10.8 Group H-2, H-3 and H-4 occupancies

6.10.8.1 Allowable area

6.10.8.1.2 Liquid storage rooms

6.10.8.1.3 Spray paint booths

6.10.8.2 Located on building perimeter

6.10.8.3 Occupancy separations

6.10.8.4 Height limitations

6.10.9 Unlimited mixed occupancy buildings with Group H-5

6.10.10 Aircraft paint hangar

6.10.11 Group E buildings

6.10.12 Motion picture theaters

6.11 MIXED USE AND OCCUPANCY

6.11.2 Accessory occupancies
7.2.4.1 Fire

7.2.3 Type II.

7.2.1 General.

TABLE 8.5.8 MAXIMUM AREA OF EXTERIOR WALL OPENINGS BASED ON FIRE 216
8.8.6 Openings
8.8.5 Exterior walls
8.8.4 Mixed openings
8.8.3 Unprotected openings
8.8.2 Protected openings
8.8.1 Allowable area of openings
8.7.9 Voids at interclauses
8.7.7 Penetrations
8.7.6 Openings
8.7.5 Vertical separation of openings
8.7.4 Exterior walls
8.7.3.10 Fire areas
8.7.3.9 Separated occupancies
8.7.3.8 Control areas
8.7.3.7 Incidental uses
8.7.3.6 Atriums
8.7.3.5 Horizontal exit
8.7.3.4 Exit passageway
8.7.3.3 Enclosures for exit access stairways
8.7.3.2 Interior exit stairway and ramp construction
8.7.3.1 Shaft enclosures
8.7.3 Fire-resistance rating
8.7.2 Materials
8.7.1 General
8.6.10 Joints
8.6.9 Penetrations
8.6.8 Openings
8.6.7 Combustible framing in fire walls
8.6.6 Vertical continuity
8.6.5.2 Horizontal projecting elements
8.6.5.1 Exterior walls
8.6.5 Horizontal continuity
8.6.4 Fire-resistance rating
8.6.3 Materials
8.6.2 Buildings with sloped roofs
8.6.1 Stepped buildings
8.6. Fire WALLS
8.5.8.6 Vertical exposure
8.5.8.5 Exterior walls
8.5.8.4 Mixed openings
8.5.8.3 Unprotected openings
8.5.8.2 Protected openings
8.5.8.1 Allowable area of openings
8.5.7.10 Ducts and air transfer openings
8.5.7.11 Parapets
8.5.7 Exterior walls
8.5.6.11 Ducts and air transfer openings
8.5.6.10 Joints
8.5.6.9 Penetrations
8.5.6.8 Openings
8.5.6 Combustible framing in fire walls
8.5.5.8.6 Vertical exposure
8.5.5.8.5 Exterior walls
8.5.5.8.4 Mixed openings
8.5.5.8.3 Unprotected openings
8.5.5.8.2 Protected openings
8.5.5.8.1 Allowable area of openings
8.5.5.7 Penetrations
8.5.5.6 Openings
8.5.5.5 Exterior walls
8.5.5.4 Structural stability
8.5.5.3 Enclosures for exit access stairways
8.5.5.2 Horizontal projecting elements
8.5.5.1 Exterior walls
8.5.5.4 Structural stability
8.5.5.3 Enclosures for exit access stairways
8.5.5.2 Horizontal projecting elements
8.5.5.1 Exterior walls
8.5.4 Penetrations
8.5.3.10 Fire areas
8.5.3.9 Separated occupancies
8.5.3.8 Control areas
8.5.3.7 Incidental uses
8.5.3.6 Atriums
8.5.3.5 Horizontal exit
8.5.3.4 Exit passageway
8.5.3.3 Enclosures for exit access stairways
8.5.3.2 Interior exit stairway and ramp construction
8.5.3.1 Shaft enclosures
8.5.3 Fire-resistance rating
8.5.2 Materials
8.5.1 General
8.4.10 Joints
8.4.9 Penetrations
8.4.8 Openings
8.4.7 Combustible framing in fire walls
8.4.6 Vertical continuity
8.4.5 Horizontal projecting elements
8.4.4 Structural stability
8.4.3 Fire-resistance rating
8.4.2 Materials
8.4.1 General
8.3.7 Prohibited penetrations
8.3.6 Atriums
8.3.5 Horizontal exit
8.3.4 Exit passageway
8.3.3 Enclosures for exit access stairways
8.3.2 Interior exit stairway and ramp construction
8.3.1 Shaft enclosures
8.3 Fire-resistance rating
8.2.6 Openings
8.2.5 Exterior walls
8.2.4 Structural stability
8.2.3 Materials
8.2.2 Materials
8.2.1 General
8.1.10 Joints
8.1.9 Penetrations
8.1.8 Openings
8.1.7 Combustible framing in fire walls
8.1.6 Vertical continuity
8.1.5 Horizontal projecting elements
8.1.4 Structural stability
8.1.3 Fire-resistance rating
8.1.2 Materials
8.1.1 General
8.7.3.10 FIRE-RESISTANCE RATING REQUIREMENTS FOR FIRE BARRIERS, FIRE WALLS OR HORIZONTAL ASSEMBLIES BETWEEN FIRE AREAS
8.12.1 General.
8.12.2 Individual dwelling unit.
8.12.3 Opening size.
8.12.4 Continuity.
8.12.5 Joint.
8.12.6 Ducts and air transfer openings.
8.12.7 Atriums.

8.11.2.4.3 Dwelling units and sleeping units.
8.11.2.4.4 Separating smoke compartments.
8.11.2.4.5 Separating incidental uses.
8.11.2.4 Fire.
8.11.2.3 Supporting construction.
8.11.2.2 Smoke and draft control doors.
8.11.2.2.1 Smoke and draft control door labeling.
8.11.2.2.2 Self- or automatic-closing doors.
8.11.2 Penetrations.
8.11.1 Joints.

8.10.7 Joints.
8.10.6 Penetrations.
8.10.5 Openings.
8.10.4 Continuity.
8.10.3 Fire.
8.10.2 Materials.
8.10.1 General.

8.9.4.1 Separating mixed occupancies.
8.9.4.2 Separating fire areas.
8.9.4.3 Dwelling units and sleeping units.
8.9.4.4 Separating smoke compartments.
8.9.4.5 Separating incidental uses.
8.9.4.6 Other separations.
8.9.2 Materials.
8.9.1 General.

8.9.3 Fire-resistance rating.
8.9.2 Continuity.
8.9.1 Materials.

8.8.8 Joints.
8.8.7 Penetrations.

8.7 Joints.
8.6 Penetrations.
8.5 Openings.
8.4 Continuity.
8.3 Fire.
8.2 Materials.
8.1 General.

8.6.9 Ducts and air transfer openings.
8.6.8 Joints.
8.6.7 Penetrations.
8.6.6 Penetrations.
8.6.5 Penetrations.
8.6.4 Penetrations.
8.6.3 Penetrations.
8.6.2 Penetrations.
8.6.1 Penetrations.

8.5.1 Group F-1 and ambulatory care facilities.
8.5 Openings.
8.4 Continuity.
8.3 Fire.
8.2 Materials.
8.1 General.

8.4.1 Separating mixed occupancies.
8.4.2 Separating fire areas.
8.4.3 Dwelling units and sleeping units.
8.4.4 Separating smoke compartments.
8.4.5 Separating incidental uses.
8.4.6 Other separations.
8.3.2 Continuity.
8.3.1 Materials.
8.3 General.

8.3.7 Joints.
8.3.6 Penetrations.
8.3.5 Penetrations.
8.3.4 Penetrations.
8.3.3 Penetrations.
8.3.2 Penetrations.
8.3.1 Penetrations.
8.3 General.

8.2.7 Joints.
8.2.6 Penetrations.
8.2.5 Penetrations.
8.2.4 Penetrations.
8.2.3 Penetrations.
8.2.2 Penetrations.
8.2.1 Penetrations.
8.2 General.

8.1.5 Joints.
8.1.4 Penetrations.
8.1.3 Penetrations.
8.1.2 Penetrations.
8.1.1 Penetrations.
8.1 General.

8.11 FLOOR AND ROOF ASSEMBLIES.
8.11.1 General.
8.11.2 Horizontal assemblies.
8.11.2.1 Materials.
8.11.2.2 Continuity.
8.11.2.3 Supporting construction.
8.11.2.4 Fire-resistance rating.
8.11.2.4.1 Separating mixed occupancies.
8.11.2.4.2 Separating fire areas.
8.11.2.4.3 Dwelling units and sleeping units.
8.11.2.4.4 Separating smoke compartments.
8.11.2.4.5 Separating incidental uses.
8.11.2.4.6 Other separations.
8.11.2.5 Ceiling panels.
8.11.2.6 Unusable space.
8.11.3 Nonfire-resistance-rated floor and roof assemblies.
8.11.3.1 Materials.
8.11.3.2 Continuity.
8.11.2 Vertical openings.
8.11.1 General.
8.11.1.1 Shaft enclosures.
8.11.1.2 Individual dwelling unit.
8.11.1.3 Escalator openings.
8.11.1.3.1 Opening size.
8.11.1.3.2 Automatic shutters.
8.11.1.4 Penetrations.
8.11.1.5 Joints.
8.11.1.5.1 Joints.
8.11.1.5.2 Joints.
8.11.1.6 Ducts and air transfer openings.
8.11.1.7 Atriums.
8.11.1.8 Masonry chimney.

8.16.3.1 Testing requirements.
8.16.2.9.4 Fire door frame labeling requirements.
8.16.2.9.3 Smoke and draft control door labeling requirements.
8.16.2.9.2 Oversized doors.
8.16.2.9.1.1 Light kits, louvers and components.
8.16.2.8.2 Oversized doors.
8.16.2.8.1 Rolling fire shutters.
8.16.2.7.1 Labeled protective assemblies.
8.16.2.7.2 Fire door labeling requirements.
8.16.2.7.1.1 Light kits, louvers and components.
8.16.2.6.2 Oversized doors.
8.16.2.5.4 Fire door frames with transom lights and sidelights in corridors and smoke barriers.
8.16.2.5.3 Fire door frames with transom lights and sidelights in corridors and smoke barriers.
8.16.2.5.2 Elevator, stairway and ramp protectives.
8.16.2.5.1.2.2 Fire resistance-rated glazing in transom lights and sidelights in corridors and smoke barriers.
8.16.2.5.1.2.1 Horizontal exits.
8.16.2.5.1.2 Fire-protection-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour.
8.16.2.5.1.1 Fire-resistance-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour.
8.16.2.5.1.2 Fire-protection-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour.
8.16.2.5.1 Fire-resistance-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour.
8.16.2.5.1 Fire-resistance-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour.
8.16.2.5.1 Fire-door hardware and closures.
8.16.2.4 Fire door frames.
8.16.2.3 Glazing in fire door assemblies.
8.16.2.2.5 Size limitations.
8.16.2.2.4 Fire-rated glazing that exceeds the Code requirements.
8.16.2.2.3 Fire-resistance-rated glazing identification.
8.16.2.2.2 Fire-protection-rated glazing identification.
8.16.2.2.1 Fire-rated glazing identification.
8.16.2.2 Marking fire-rated glazing assemblies.
8.16.2.1 Safety glazing.
8.16.2.1 Glazing.
8.16.2 Fire door assemblies.
8.16.2.1 Testing requirements.
8.16.2.1.1 Side-hinged or pivoted swinging doors.
8.16.2.1.2 Other types of assemblies.
8.16.2.1.3 Glazing in transom lights and sidelights in corridors and smoke barriers.
8.16.2.1.4 Smoke and draft control.
8.16.2.2 Performance requirements.
8.16.2.2.1 Door assemblies in corridors and smoke barriers.
8.16.2.2.1.1 Smoke and draft control.
8.16.2.2.2 Door assemblies in other fire partitions.
8.16.2.2.3 Doors in interior exit stairways and ramps and exit passageways.
8.16.2.2.3.1 Glazing in doors.
8.16.2.2.3 Fire doors.
8.16.2.1.1 Exterior curtain wall/nonfire-resistance-rated floor assembly interclauses.
8.16.2.1.2 Exterior curtain wall/vertical fire barrier interclauses.
8.16.2.1.4 Exterior curtain wall/floor interclause.
8.18.2.1.4 Fireblocking integrity.
8.18.2.1.1 Batts or blankets of mineral wool or mineral fiber.
8.18.2.1.2 Unfaced fiberglass.
8.18.2.1.3 Loose-fill insulation material.
8.18.2.1.4 Fireblocking integrity.

8.17.2.1 Smoke control system.
8.17.2.1.1 Ducts that penetrate fire-resistance-rated assemblies without dampers.
8.17.2.1.2 Ducts that penetrate nonfire-resistance-rated assemblies.
8.17.2.2 Hazardous exhaust ducts.
8.17.3 Damper testing, ratings and actuation.
8.17.3.1 Damper testing.
8.17.3.2 Damper rating.
8.17.3.2.1 Fire damper ratings.
8.17.3.2.2 Smoke damper ratings.
8.17.3.2.3 Combination fire/smoke damper ratings.
8.17.3.2.4 Corridor damper ratings.
8.17.3.3 Damper actuation.
8.17.3.3.1 Fire damper actuation device.
8.17.3.3.2 Smoke damper actuation.
8.17.3.3.3 Combination fire/smoke damper actuation.
8.17.3.3.4 Ceiling radiation damper actuation.
8.17.3.3.5 Corridor damper actuation.
8.17.4 Access and identification.
8.17.5 Where required.
8.17.5.1 Fire walls.
8.17.5.1.1 Horizontal exits.
8.17.5.2 Fire barriers.
8.17.5.2.1 Horizontal exits.
8.17.5.3 Shaft enclosures.
8.17.5.4.1 Corridors.
8.17.5.6 Exterior walls.
8.17.5.7 Smoke partitions.
8.17.6 Horizontal assemblies.
8.17.6.1 Through penetrations.
8.17.6.2 Membrane penetrations.
8.17.6.2.1 Ceiling radiation dampers testing and installation.
8.17.6.3 Nonfire-resistance-rated floor assemblies.
8.17.7 Flexible ducts and air connectors.
8.18 CONCEALED SPACES.
8.18.1 General.
8.18.2 Fireblocking.
8.18.2.1 Fireblocking materials.
8.18.2.1.1 Batts or blankets of mineral wool or mineral fiber.
8.18.2.1.2 Unfaced fiberglass.

# Table of Contents

17.10.4.1 Basic data ................................................. 533
17.10.3.1 Reliability Differentiation .......................... 533
17.9.8 Force Coefficients \( f \) .................................. 533
17.8.4 (1) Loads on Railings ................................... 534

## PART 17: STRUCTURAL LOADS AND DESIGN

17.12.1 Photovoltaic panels and modules .................. 536

### 17.1 SCENE

17.1.2 This part of the Code does not cover .................. 536

### 17.2 DESIGN REQUIREMENTS

17.2.2 Design Basis ........................................... 536
17.2.3 Deflections ............................................. 536

### 17.3 CONSTRUCTION DOCUMENTS

17.3.1 General .................................................. 537
17.3.1.1 Floor live load ...................................... 537
17.3.1.2 Roof live load ....................................... 538

### 17.4 DESIGN LOADS AND EFFECTS

17.5 LIMIT STATE DESIGN .................................... 539
17.5.2 Methods of Limit State Design ....................... 540
17.5.2.1 Ghana, British System GS (BS 8110: Part 1) .... 540
17.5.2.1.1 Required Strength for Ultimate Limit State . 540
17.5.2.1.2 Values for a Serviceability Limit State ....... 541
17.5.2.2 EuroCode System GS (BS EN 1990, BS EN 1991, BS EN 1992) ........................................... 541
17.5.2.2.1 Required strength for Ultimate Limit State . 541
17.5.2.2.2 Values for Serviceability Limit State ....... 543

### 17.6 DEAD LOADS .............................................. 544

### 17.7 LIVE (IMPOSED) LOADS DUE TO USE AND OCCUPANCY

17.7.2 Floor Live Loads ........................................ 544
17.7.3 Reduction in Total Imposed Floor Loads ............ 545
17.7.4 Roof Live Loads other than Wind Loads or Rain Loads .............. 545

### 17.8 DYNAMIC LOADING ..................................... 549
17.8.4 (1) Loads on Railings ................................... 550

### 17.9 EFFECTS OF WIND ...................................... 551

17.3.1 Scope .................................................... 551
17.3.2 Definitions .............................................. 551
17.3.3 Nomenclature ........................................... 551
17.3.4 Procedure for calculating Wind Loads on Structures .............. 552
17.9.5 Design Wind Speed, \( V_s \) ................................ 553
17.9.6 Dynamic Pressure of the Wind ......................... 561
17.9.7 Pressure Coefficients and Force Coefficients ........ 563
17.9.8 Force Coefficients for Unclad Structures ............ 577

### 17.10 EFFECTS OF EARTHQUAKES

17.10.1 SCOPE AND FIELD OF APPLICATION .................. 582

### 17.10.3 DESIGN CRITERIA

17.10.3.1 Reliability Differentiation ....................... 583
17.10.3.2 Ductility Levels .................................... 584
17.10.4 METHODS OF ASSESSMENT ............................ 584
17.10.4.1 Basic data ........................................... 584
17.10.4.1.1 Material Characteristics ....................... 584
17.10.4.1.1 (1) Concrete ........................................................................................................684
17.10.4.1.1(2) Steel ........................................................................................................684
17.10.4.1.2 Material Safety Factor ..................................................................................684
17.10.4.1.4 Design Load Combination .......................................................................685
17.10.4.2 Structural analysis ..........................................................................................685
17.10.4.2.1 Building Configuration ...............................................................................685
17.10.4.2.2 Application of Seismic Action ..................................................................686
17.10.4.2.3 Analytical Model .......................................................................................686
17.10.5.1 Seismic Zones ...............................................................................................688
17.10.5.2 Characteristics of Seismic Actions .................................................................689
17.10.5.3 Design Seismic Action ..................................................................................689
17.10.5.3.1 Normalized Elastic Response Spectrum ...................................................689
17.10.5.3.2 Site Effects ................................................................................................689
17.10.5.3.3 Site - Dependant Normalized Elastic Response Spectrum ..........................690
17.10.5.3.4 Design Response Spectrum ......................................................................690
17.10.6 DESIGN ACTIONS ..........................................................................................691
17.10.6.1 General ..........................................................................................................691
17.10.6.2 Ductility Level I: DL I ..................................................................................691
17.10.6.3 Ductility Level II: DL II ................................................................................691
17.10.6.4 Ductility Level III: DL III .............................................................................693
17.10.7.2 Beam - Column Joints (DL III only) ...............................................................698
17.10.7.3 Structural Walls ............................................................................................600
17.10.7.4 Verifications ..................................................................................................601
17.10.8 DETAILING, EXECUTION, USE ......................................................................602
17.10.8.1 General ..........................................................................................................602
17.10.8.2 Elements Subject to Bending (N_d ≤ 0.1 \cdot A_k \cdot f_{cd}) ....................................602
17.10.8.2.1 Geometrical Constraints .........................................................................602
17.10.8.2.2 Longitudinal Reinforcement ....................................................................603
17.10.8.2.3 Minimum Transverse Reinforcement ........................................................603
17.10.8.3 Elements Subject to Bending and Axial Force (N_d > 0.1 \cdot A_k \cdot f_{cd}) ..........604
17.10.8.3.1 General .......................................................................................................604
17.10.8.3.3 Longitudinal Reinforcement .....................................................................605
17.10.8.3.4 Transverse Reinforcement .......................................................................605
17.10.8.4 Beam - Column Joints ..................................................................................609

PART 22: MASONRY

22.1 GENERAL

22.1.1 Scope

22.1.2 Design methods

22.1.2.1 Masonry veneer

22.1.3 Special inspection

22.2 NOTATIONS

22.2.1 General

22.3 MASONRY CONSTRUCTION MATERIALS

22.3.1 Masonry units

22.3.1.1 Second-hand units

22.3.2 Mortar

22.3.2.1 Masonry mortar

22.3.2.2 Surface-bonding mortar

22.3.2.3 Mortars for ceramic wall and floor tile

22.3.2.3.1 Dry-set Portland cement mortars

22.3.2.3.2 Latex-modified Portland cement mortar

22.3.2.3.3 Epoxy mortar

22.3.2.3.4 Furan mortar and grout

22.3.2.3.5 Modified epoxy-emulsion mortar and grout

22.3.2.3.6 Organic adhesives

22.3.2.3.7 Portland cement grouts

22.3.2.4 Mortar for adhered masonry veneer

22.3.3 Grout

22.3.4 Metal reinforcement and accessories

22.4 CONSTRUCTION

22.4.1 Masonry construction

22.4.1.1 Support on wood

22.4.1.2 Molded cornices

22.5 QUALITY ASSURANCE

22.5.1 General

22.6 SEISMIC DESIGN

22.6.1 Seismic design requirements for masonry

22.7 ALLOWABLE STRESS DESIGN

22.7.1 General

22.7.2 TMS 402, Clause 6.1.6.1.1, lap splices

22.7.2.1 Lap splices

22.7.2.2 TMS 402, Clause 6.1.6.1, splices of reinforcement

22.8 STRENGTH DESIGN OF MASONRY

22.8.1 General

22.8.2 TMS 402, Clause 6.1.5.1.1, development

22.8.3 TMS 402, Clause 6.1.6.1.1, splices

22.9 EMPIRICAL DESIGN OF ADOBE MASONRY

22.9.1 General

22.9.1.1 Limitations

22.9.2.1 Unstabilized adobe

22.9.2.1.1 Compressive strength

22.9.2.1.2 Modulus of rupture

22.9.2.1.2.1 Support conditions

22.9.2.1.2.2 Loading conditions

22.9.2.1.2.3 Testing procedure

22.9.2.1.2.4 Modulus of rupture determination

22.9.2.1.3 Moisture content requirements

22.9.2.1.4 Shrinkage cracks

22.9.2.2 Stabilized adobe

22.9.2.2.1 Soil requirements

22.9.2.2.2 Absorption requirements

22.9.2.3 Allowable stress

22.9.2.3.1 Bolts

22.9.2.4 Detailed requirements

27.6.1 General ............................................................................................... 869
27.6.2 Approval for use ............................................................................... 869
27.6.3 Identification ...................................................................................... 870
27.6.4 Specifications ..................................................................................... 870
27.6.5 Structural requirements ................................................................... 870
27.6.6 Fastening ............................................................................................ 870
27.6.7 Light-diffusing systems .................................................................... 870
27.6.7.1 Support .......................................................................................... 870
27.6.7.2 Installation ...................................................................................... 870
27.6.7.3 Size limitations .............................................................................. 871
27.6.7.4 Fire suppression system ................................................................. 871
27.6.7.5 Electrical luminaires .................................................................... 871
27.6.8 Partitions ............................................................................................ 871
27.6.9 Bathroom accessories ....................................................................... 871
27.6.10 Awnings, patio covers and similar structures ............................ 871
27.6.11 Greenhouses .................................................................................... 871
27.6.12 Solar collectors ............................................................................... 871
27.7 LIGHT-TRANSMITTING PLASTIC WALL PANELS ............................. 871
27.7.1 General ............................................................................................... 871
27.7.2 Installation ........................................................................................ 871
27.7.3 Height limitation .............................................................................. 872
27.7.4 Area limitation and separation .......................................................... 872
27.7.5 Automatic sprinkler system ............................................................... 872
27.7.6 Combinations of glazing and wall panels ................................................................. 873
27.8 LIGHT-TRANSMITTING PLASTIC GLAZING ............................................................... 873
27.8.1 Buildings of Type VB construction ........................................................................... 873
27.9 LIGHT-TRANSMITTING PLASTIC ROOF PANELS ....................................................... 873
27.9.1 General ....................................................................................................................... 873
27.9.2 Separation .................................................................................................................. 873
27.9.3 Location ..................................................................................................................... 874
27.9.4 Area limitations ........................................................................................................ 874
27.10 LIGHT-TRANSMITTING PLASTIC SKYLIGHT GLAZING ............................................. 874
27.10.1 Light-transmitting plastic glazing of skylight assemblies ......................................... 874
27.10.2 Mounting ................................................................................................................ 874
27.10.3 Slope ....................................................................................................................... 875
27.10.4 Maximum area of skylights ..................................................................................... 875
27.10.5 Aggregate area of skylights .................................................................................... 875
27.10.6 Separation ................................................................................................................ 875
27.10.7 Location ................................................................................................................... 875
27.10.8 Combinations of roof panels and skylights .............................................................. 875
27.11 LIGHT-TRANSMITTING PLASTIC INTERIOR SIGNS ................................................ 875
27.11.1 General ................................................................................................................... 875
27.11.2 Maximum area ....................................................................................................... 876
27.11.3 Separation ............................................................................................................... 876
27.11.4 Encasement ............................................................................................................ 876
27.12 PLASTIC COMPOSITES .............................................................................................. 876
27.12.1 General ................................................................................................................... 876
27.12.2 Labeling .................................................................................................................. 876
27.12.3 Flame spread index .............................................................................................. 876
27.12.4 Termite and decay resistance ............................................................................... 876
27.12.5 Construction requirements .................................................................................. 876
27.12.5.1 Span rating ........................................................................................................ 876
27.12.6 Plastic composite deck boards, stair treads, handrails and guards ......................... 876
27.13 FIBRE-REINFORCED POLYMER ................................................................................ 876
27.13.1 General ................................................................................................................... 876
27.13.2 Labeling and identification ..................................................................................... 876
27.13.3 Interior finishes ....................................................................................................... 877
27.13.3.1 Foam plastic cores .......................................................................................... 877
27.13.4 Light-transmitting materials .............................................................................. 877
27.13.5 Exterior use ............................................................................................................ 877
27.14 REFLECTIVE PLASTIC CORE INSULATION .............................................................. 878
27.14.1 General ................................................................................................................... 878
27.14.2 Identification ......................................................................................................... 878
27.14.3 Surface-burning characteristics ......................................................................... 878
27.14.4 Room corner test heat release ............................................................................ 878
PART 28: ELECTRICAL SYSTEMS AND ALLIED INSTALLATIONS .................................. 878
28.1 GENERAL .................................................................................................................... 878
28.1.1 Scope ...................................................................................................................... 878
28.2 DEFINITIONS AND CONVENTIONAL SYMBOLS ...................................................... 878
28.2.1 For the purpose of this Clause, the following definitions shall apply ....................... 878
28.2.2 CONVENTIONAL SYMBOLS ................................................................................ 884
28.3 GENERAL REQUIREMENTS ...................................................................................... 884
28.3.1 Conformity with Ghana Wiring Code .................................................................... 884
28.3.2 Materials ................................................................................................................ 884
28.3.3 Co-ordination with Local Supply Authority ............................................................ 884
28.3.4 Power Factor Improvement in Consumers’ Installation ............................................ 885
28.3.5 Execution of Work .................................................................................................. 885
28.4 PLANNING OF ELECTRICAL INSTALLATIONS ......................................................... 885
28.4.1 General ................................................................................................................... 885
28.4.2 All electrical apparatus shall be suitable for the services these are intended for: .... 885
28.4.3 Co-ordination .......................................................................................................... 885
28.4.2.1 Location ............................................................................................................. 886
28.4.2.2 Type of building for substations ....................................................................... 887
28.4.2.3 Layout of substation ................................................................. 887
28.4.2.4 Room/spaces required ............................................................ 887
28.4.3 Location of switch room ............................................................ 890
28.4.4 Location and requirements of distribution panels ......................... 891
28.4.5 Substation safety ...................................................................... 891
28.4.6 Overhead lines, wires and cables ................................................. 891
28.4.6.1 Height requirement ................................................................ 891
28.4.6.2 Position, insulation and protection of overhead lines ................. 892
28.4.6.3 Precautions against access and warnings of dangers .................. 892
28.4.6.4 Fitting of insulators to stay wires ............................................. 892
28.4.7 Maps of underground networks .................................................. 892
28.5 LIGHTING ............................................................................. 893
28.5.1 Principles of lighting ................................................................ 893
28.5.1.1 Aims of good lighting ............................................................ 893
28.5.1.1.1 Realization of these aims involves: ...................................... 893
28.5.1.2 Planning the brightness pattern .............................................. 893
28.5.1.3 Recommended values of illuminance ...................................... 894
28.5.1.3.1 The different locations and tasks are grouped within the following four clauses: 894
28.5.1.4 Glare ............................................................................. 894
28.5.1.5 Lighting for movement about a building .................................. 895
28.5.1.5.1 Corridors, passages and stairways ..................................... 895
28.5.1.5.2 Entrances .................................................................... 908
28.5.2 Daylight ............................................................................ 908
28.5.2.4 Components of Daylight Factor ............................................ 908
28.5.2.5 Sky Component (SC) ............................................................ 909
28.5.2.5.2 Corrections for window bars ........................................... 909
28.5.2.5.3 Correction for glazing ..................................................... 909
28.5.2.5.4 Correction for external obstructions ................................. 909
28.5.2.6 External Reflected Component (ERC) .................................... 909
28.5.2.6.1 For method of calculating ERC, reference may be made to accepted standard .... 909
28.5.2.7 Internal Reflected Component (IRC) ...................................... 909
28.5.2.8 General principles of openings to afford good lighting ............ 910
28.5.2.9 Availability of daylight in multi-storeyed block ........................ 910
28.5.3 Artificial lighting ................................................................... 911
28.5.3.2 Artificial lighting design for interiors ...................................... 911
28.5.3.2.2 Selection of the light sources and luminaires ..................... 912
28.5.3.2.3 Determination of the luminous flux .................................. 912
28.5.3.2.4 Arrangement of the luminaires ........................................ 912
28.5.3.3 Artificial lighting to supplement daylighting ......................... 913
28.5.4 Energy conservation in lighting ................................................. 914
28.5.4.3.3 Method of use ............................................................... 915
28.5.4.6 Artificial lighting ................................................................. 916
28.5.4.6.1 Efficient artificial light sources and luminaires .................. 916
28.5.4.7 Cleaning schedule for window panes and luminaires .......... 918
28.5.4.8 Photocontrols for artificial lights .......................................... 918
28.5.4.9 Solar Photovoltaic Systems (SPV), ........................................ 918
28.5.4.9.1 SPV lighting system should preferably be provided with CFL for energy efficiency .... 918
28.5.4.9.3 Regular maintenance of SPV system is necessary for its satisfactory functioning .... 918
28.6 ELECTRICAL POWER AND LIGHTING SYSTEMS ...................... 918
28.6.2.1.1 Occupant sensor control function ..................................... 919
28.6.2.1.2 Occupant sensor control function in warehouses ................. 919
28.6.2.1.3 Occupant sensor control function in open plan office areas .......... 919
28.6.2.2 Time-switch controls ............................................................. 920
28.6.2.2.1 Time-switch control function .......................................... 920
28.6.2.2.2 Light-reduction controls ................................................ 920
28.6.2.3 Daylight-responsive controls ............................................... 921
28.7 DISTRIBUTION OF SUPPLY AND CABLING ............................ 924
28.7.1 General ........................................................................... 924
28.7.2 System of Supply ................................................................ 924
28.7.2.1 All electrical apparatus shall be suitable for the voltage and frequency of supply ...... 924
28.7.3 Substation equipment and accessories ....................................... 925
28.7.3.1 High voltage switchgear ........................................................................... 925
28.7.3.2 Cables ........................................................................................................ 926
28.7.3.2.4 Colour identification of cores of non-flexible cables ......................... 926
28.7.3.2.5 Colour, identification of cores of flexible cables and flexible cords. .... 926
28.7.3.3 High voltage busbar trunking/ducting ...................................................... 927
28.7.3.4 MV/LV busbar trunking/rising mains ....................................................... 927
28.7.3.5 Transformers .............................................................................................. 928
28.7.3.6 Switchgear .................................................................................................. 929
28.7.3.6.2 Location .................................................................................................. 930
28.7.3.6.3 Distribution boards ................................................................................. 930
28.7.3.6.4 Branch distribution boards ................................................................... 933
28.7.3.6.5 Location of distribution boards ............................................................... 934
28.7.3.6.6 Protection of circuits .............................................................................. 934
28.7.4 Voltage and frequency of supply .................................................................. 935
28.7.5 Rating of cables and equipments .................................................................. 935
28.7.6 Installation circuits ......................................................................................... 935
28.7.6.1 Selecting and installing cables ..................................................................... 936
28.7.6.1.1 Cable insulation types ............................................................................. 936
28.7.6.1.2 Circuit wire sizes ..................................................................................... 936
28.7.6.2 Requirements for physical protection of underground cables ................. 937
28.7.7 Lighting and levels of illumination .................................................................. 937
28.7.7.1 General ........................................................................................................ 937
28.7.7.2 Future demand ............................................................................................ 938
28.7.7.3 Principles of lighting ................................................................................... 938
28.7.7.6 Energy conservation ................................................................................... 938
28.7.9 Guidelines for electrical layout in residential buildings ............................... 938
28.7 WIRING ............................................................................................................ 940
28.8 FITTING AND ACCESSORIES .......................................................................... 940
28.8.9.1 Ceiling roses and similar attachments ......................................................... 940
28.8.9.2 Socket-outlets and plugs ............................................................................. 940
28.8.9.3 Lighting fittings .......................................................................................... 940
28.8.9.4. Fitting – wire ............................................................................................ 941
28.8.9.5 Lamp holders ............................................................................................. 941
28.8.9.6 Outdoor lamps ........................................................................................... 941
28.8.9.7 Lamps .......................................................................................................... 941
28.8.9.8 Fans, regulators and clamps ........................................................................ 941
28.8.9.8.1 Ceiling fans ............................................................................................. 941
28.8.9.8.2 Exhaust fans ............................................................................................ 942
28.8.9.10 Interchangeability ...................................................................................... 944
28.8.9.11 Equipment .................................................................................................. 944
28.8.9.12 Fannage .................................................................................................... 944
28.8.10 EARTHING .................................................................................................. 944
28.8.10.1 General ....................................................................................................... 944
28.8.10.2 Earth electrodes ......................................................................................... 945
28.8.10.4 Equipment and portions of installations which shall be earthed .......... 946
28.8.10.4.1 Equipment to be earthed ....................................................................... 946
28.8.10.4.2 Structural metal work ............................................................................ 946
28.8.10.5 Neutral earthing ......................................................................................... 946
28.8.10.6 System of earthing ..................................................................................... 948
28.8.11 INSPECTION AND TESTING OF INSTALLATION ..................................... 949
28.8.11.1 General requirements ............................................................................... 949

29.2.3.5.2.4 Fire and smoke detection ....................................................... 997
29.2.3.5.2.5 Smoke control ................................................................. 997
29.2.3.6 Application factors ................................................................. 998
29.2.3.6.1 General ................................................................. 998
29.2.3.6.1.1 Commercial applications .......................................................... 998
29.2.3.6.1.2 Offices ............................................................................. 998
29.2.3.6.1.3 Hotel guest rooms ............................................................... 998
29.2.3.6.1.4 Restaurants, cafeteria, bars and night-clubs .................................. 999
29.2.3.6.1.5 Department stores/shops ....................................................... 999
29.2.3.6.1.6 Theatres/auditoria ............................................................... 999
29.2.3.6.1.7 Special applications ............................................................... 999
29.2.3.6.1.7.1 Hospital/operating theatres .................................................. 999
29.2.3.6.1.7.2 Computer rooms .............................................................. 1000
29.2.3.6.1.8 Residential buildings ........................................................... 1000
29.2.4 Noise and vibration control ........................................................ 1000
29.2.4.1 General ............................................................................. 1000
29.2.4.2 Types of noise in building ......................................................... 1000
29.2.4.2.1 Externally created noise .......................................................... 1000
29.2.4.2.2 Generated noise .................................................................. 1001
29.2.4.2.3 Transmitted noise ................................................................. 1001
29.2.4.2.4 Intermittent noise ................................................................. 1001
29.2.4.5 Noise control ................................................................. 1001
29.2.4.5.2 From split air-conditioner/furred in ............................................ 1001
29.2.4.5.3 Air handling units (floor mounted and ceiling suspended) ................ 1002
29.2.4.5.4 From plenum chamber ............................................................ 1002
29.2.4.5.5 From fans ........................................................................... 1002
29.2.4.5.5.1 Centrifugal fans ................................................................... 1002
29.2.4.5.5.2 Axial fans ........................................................................... 1002
29.2.4.5.5.3 To reduce fan noise, the following should be adopted: ................. 1002
29.2.4.5.6 From chillers, pumps and pipes .................................................. 1003
29.2.4.5.7 From ducting work ............................................................... 1003
29.2.4.6 Structure borne noise .............................................................. 1004
29.2.4.7 Measurement ....................................................................... 1004
29.2.5 Mechanical ventilation (for non air conditioned areas) and evaporative cooling .......................................................... 1005
29.2.5.1 Ventilation ........................................................................ 1005
29.2.5.2 Beneficial effects of ventilation ................................................... 1006
29.2.5.2.1 Fresh air supply ................................................................. 1006
29.2.5.2.2 Transfer of heat/moisture .......................................................... 1006
29.2.5.2.3 Air movement ................................................................. 1006
29.2.5.2.4 Air purity and filtration ............................................................ 1006
29.2.5.2.5 Removal of particulate matter from air ........................................... 1006
29.2.5.2.6 Fire and smoke control ............................................................ 1006
29.2.5.2.7 Removal of fumes and smells from air ........................................... 1006
29.2.5.3 Industrial ventilation ............................................................... 1007
29.2.5.4 Types of ventilation systems ...................................................... 1007
29.2.5.4.1 Mechanical extract/natural supply ............................................. 1007
29.2.5.4.2 Mechanical supply/natural extract ............................................... 1007
29.2.5.4.3 Combined mechanical supply and extract ..................................... 1007
29.2.5.5 Ventilation rate and design consideration for non-air conditioned areas .......................................................... 1007
29.2.5.5.1 General ventilation ............................................................... 1007
29.2.5.5.2 Kitchen (industrial and commercial) ventilation ................................. 1009
29.2.12.3 Commissioning, testing, adjusting and balancing ........................................... 1026
29.2.12.3.1 Basic considerations ....................................................................................... 1026
29.2.12.3.1.1 The basic considerations are: ................................................................... 1026
29.2.12.3.2 System testing, adjusting and balancing ....................................................... 1026
29.2.12.3.2.1 Refrigeration plant .................................................................................... 1026
29.2.12.3.2.2 Air system ............................................................................................... 1026
29.2.12.3.2.2.1 Air handlers performance .................................................................... 1026
29.2.12.3.2.2.2 Air distribution ..................................................................................... 1027

PART 1: SCOPE AND ADMINISTRATION

User notes:
About this Part: Part 1 establishes the limits of applicability of the Code and describes how the Code is to be applied and enforced. This Code is intended to be adopted as a legally enforceable document and it cannot be effective without adequate provisions for its administration and enforcement. The provisions of Part 1 establish the authority and duties of the Code official appointed by the authority having jurisdiction and also establish the rights and privileges of the design professional, contractor and property owner. Part 1 is largely concerned with maintaining “due process of law” in enforcing the building performance criteria contained in the body of the Code.

SCOPE AND APPLICATION

1 GENERAL

1.1 Title.

These regulations shall be known as the Building Code of the Republic of Ghana hereinafter referred to as “this Code.”

1.1.2 Scope.

The provisions of this Code shall apply to the construction, alteration, relocation, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal and demolition of every building structure or any appurtenances connected or attached to such buildings or structures.

Exception: Detached one- and two-family dwellings and townhouses not more than three stories above grade plane in height with a separate means of escape, and their accessory structures not more than three stories above grade plane in height, shall comply with this Code or the Ghana Residential Code.

1.1.2.1 Appendices.

Provisions in the appendices shall not apply unless specifically adopted.

1.1.3 Intent.

The purpose of this Code is to establish the minimum requirements to provide a reasonable level of safety, public health and general welfare through structural strength, means of escape facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life and property from fire, explosion and other hazards, and to provide a reasonable level of safety to fire fighters and emergency responders during emergency operations.

1.1.4 Referenced Codes.

The other Codes listed in Clauses 1.1.4.1 through 1.1.4.7 and referenced elsewhere in this Code shall be considered to be part of the requirements of this Code to the prescribed extent of each such reference.

1.1.4.1 Gas.

The provisions of this Code shall apply to the installation of gas piping from the point of delivery, gas appliances and related accessories as covered in this Code. These requirements apply to gas piping systems extending from the point of delivery to the inlet connections of appliances and the installation and operation of residential and commercial gas appliances and related accessories.

1.1.4.2 Mechanical.

The provisions of this Code shall apply to the installation, alterations, repairs and replacement of mechanical systems, including equipment, appliances, fixtures, fittings and appurtenances, including ventilating, heating, cooling, air-conditioning and refrigeration systems, incinerators and other energy-related systems.

1.1.4.3 Plumbing.

The provisions of this Code shall apply to the installation, alteration, repair and replacement of plumbing systems, including equipment, appliances, fixtures, fittings and appurtenances, and where connected to a water or sewage
system and all aspects of a medical gas system. The provisions of this Code shall apply to private sewage disposal systems.

1.1.4.4 Property maintenance.

The provisions of this Code shall apply to existing structures and premises; equipment and facilities; light, ventilation, space heating, sanitation, life and fire safety hazards; responsibilities of owners, operators and occupants; and occupancy of existing premises and structures.

1.1.4.5 Fire prevention.

The provisions of this Code shall apply to matters affecting or relating to structures, processes and premises from the hazard of fire and explosion arising from the storage, handling or use of structures, materials or devices; from conditions hazardous to life, property or public welfare in the occupancy of structures or premises; and from the construction, extension, repair, alteration or removal of fire suppression, automatic sprinkler systems and alarm systems or fire hazards in the structure or on the premises from occupancy or operation.

1.1.4.6 Energy.

The provisions of this Code shall apply to all matters governing the design and construction of buildings for energy efficiency.

1.1.4.7 Existing buildings.

The provisions of this Code shall apply to matters governing the repair, alteration, change of occupancy, addition to and relocation of existing buildings.

1.2 APPLICABILITY

1.2.1 General.

Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall be applicable. Where, in any specific case, different clauses of this Code specify different materials, methods of construction or other requirements, the most restrictive shall govern.

1.2.2 Application of references.

References to Part or clause numbers, or to provisions not specifically identified by number, shall be construed to refer to such part, clause or provision of this Code.

1.2.3 Referenced Codes and standards.

The Codes and standards referenced in this Code shall be considered to be part of the requirements of this Code to the prescribed extent of each such reference and as further regulated in Clauses 1.2.3.1 and 1.2.3.2.

1.2.3.1 Conflicts.

Where conflicts occur between provisions of this Code and referenced Codes and standards, the provisions of this Code shall apply.

1.2.3.2 Provisions in referenced Codes and standards.

Where the extent of the reference to a referenced Code or standard includes subject matter that is within the scope of this Code or those listed in Clause 1.1.4, the provisions of this Code as listed in Clause 1.1.4, as applicable, shall take precedence over the provisions in the referenced Code or standard.

1.2.4 Partial invalidity.

In the event that any part or provision of this Code is held to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

1.2.5 Existing structures.

The legal occupancy of any structure existing on the date of adoption of this Code shall be permitted to continue without change, except as otherwise specifically provided in this Code, or the Ghana Fire Code.

1.2.5.1 Buildings not previously occupied.

A building or portion of a building that has not been previously occupied or used for its intended purpose in existence at the time of its completion shall comply with the provisions of this Code as applicable, for new construction or with any current permit for such occupancy.
1.2.5.2 Buildings previously occupied.

The legal occupancy of any building existing on the date of adoption of this Code shall be permitted to continue without change, except as otherwise specifically provided in this Code, the Ghana Fire Code or as is deemed necessary by the Head of Works for the general safety and welfare of the occupants and the public.

ADMINISTRATION AND ENFORCEMENT

1.3 BUILDING SAFETY

1.3.1 Enforcement agency.

The Works Department of the Metropolitan, Municipal and District Assemblies (MMDAs) shall be in-charge of building safety and the officer in charge thereof shall be the Head of Works.

1.3.1.1 Appointment

The Head of Works shall be appointed by the Authority.

1.3.1.2 Organization

The Head of Works shall appoint such number of officers, technical assistants, inspectors and other employees as shall be necessary for the administration of the Code and as authorized by the Authority.

1.3.1.3 Delegation of Powers

The Head of Works may designate an employee or employees who shall exercise all the powers of the office during the temporary absence or disability of the Head of Works.

1.3.1.4 Qualification of Head of Works

The Head of Works shall be a licensable Engineer or Structural Engineer or Architect or Town Planner or Quantity Surveyor/Surveyor Valuer whose qualification shall not in any case be less than those prescribed in Appendix A.

1.3.1.5 In small local/district bodies having insufficient funds to appoint such officials with the above qualifications, two or more such bodies could join and have one qualified Head of Works.

1.3.1.6 Qualifications of Building Assistant Supervisor

No person shall be appointed as Building Assistant/Supervisor unless such a person has the qualifications prescribed in Appendix A for a licensed building Supervisor.

1.4 DUTIES AND POWERS OF HEAD OF WORKS

1.4.1 General.

The Head of Works is hereby authorized and directed to enforce the provisions of this Code. The Head of Works shall have the authority to render interpretations of this Code and to adopt policies and procedures in order to clarify the application of its provisions. Such interpretations, policies and procedures shall be in compliance with the intent and purpose of this Code. Such policies and procedures shall not have the effect of waiving requirements specifically provided for in this Code.

1.4.2 Applications and permits.

The Head of Works shall receive applications, review construction documents and issue permits for the erection, and alteration, demolition and moving of buildings and structures, inspect the premises for which such permits have been issued and enforce compliance with the provisions of this Code.

1.4.2.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas.

For applications for reconstruction, rehabilitation, repair, alteration, addition or other improvement of existing buildings or structures located in flood hazard areas, the Head of Works shall determine if the proposed work constitutes substantial improvement or repair of substantial damage. Where the Head of Works determines that the proposed work constitutes substantial improvement or repair of substantial damage, and where required by this Code.
1.4.3 Notices and orders.

The Head of Works shall issue necessary notices or orders to ensure compliance with this Code.

1.4.4 Inspections.

The Head of Works shall make the required inspections, or the Head of Works shall have the authority to accept reports of inspection by approved agencies or individuals. Reports of such inspections shall be in writing and be certified by a responsible officer of such approved agency or by the responsible individual. The Head of Works is authorized to engage such expert opinion as deemed necessary to report on unusual technical issues that arise, subject to the approval of the appointing authority.

1.4.5 Identification.

The Head of Works shall carry proper identification when inspecting structures or premises in the performance of duties under this Code.

1.4.6 Right of entry.

Where it is necessary to make an inspection to enforce the provisions of this Code, or where the Head of Works has reasonable cause to believe that there exists in a structure or on a premises a condition that is contrary to or in violation of this Code that makes the structure or premises unsafe, dangerous or hazardous, the Head of Works is authorized to enter the structure or premises at reasonable times to inspect or to perform the duties imposed by this Code, provided that if such structure or premises be occupied that credentials be presented to the occupant and entry requested. If such structure or premises is unoccupied, the Head of Works shall first make a reasonable effort to locate the owner or other person having charge or control of the structure or premises and request entry. If entry is refused, the Head of Works shall have recourse to the remedies provided by law to secure entry.

1.4.7 Department records.

The Head of Works shall keep official records of applications received, permits and certificates issued, fees collected, reports of inspections, and notices and orders issued. Such records shall be retained in the official records for the period required for retention of public records.

1.4.8 Liability.

The Head of Works, member of the board of appeals or employee charged with the enforcement of this Code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this Code or other pertinent law or ordinance, shall not thereby be civilly or criminally rendered liable personally and is hereby relieved from personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

1.4.8.1 Legal defense.

Any suit or criminal complaint instituted against an officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this Code shall be defended by legal representatives of the jurisdiction until the final termination of the proceedings. The Head of Works or any subordinate shall not be liable for cost in any action, suit or proceeding that is instituted in pursuance of the provisions of this Code.

1.4.9 Approved materials and equipment.

Materials, equipment and devices approved by the Head of Works shall be constructed and installed in accordance with such approval.

1.4.9.1 Used materials and equipment.

Materials that are reused shall comply with the requirements of this Code for new materials. Used equipment and devices shall not be reused unless approved by the Head of Works.

1.4.10 Modifications.

Where there are practical difficulties involved in carrying out the provisions of this Code, the Head of Works shall have the authority to grant modifications for individual cases, upon application of the owner or the owner’s authorized agent, provided that the Head of Works shall first find that special individual reason makes the strict letter of this Code impractical, the modification is in compliance
with the intent and purpose of this Code and that such modification does not lessen health, accessibility, life and fire safety or structural requirements. The details of action granting modifications shall be recorded and entered in the files of the department of building safety.

1.4.10.1 Flood hazard areas.

The Head of Works shall not grant modifications to any provision required in flood hazard areas as established by this Code unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of this Code inappropriate.

2. A determination that failure to grant the variance would result in exceptional hardship by rendering the plot undevelopable.

3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety, extraordinary public expense, cause fraud on or victimization of the public, or conflict with existing Code or legislation.

4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.

5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

1.4.11 Alternative materials, design and methods of construction and equipment.

The provisions of this Code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this Code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the Head of Works finds that the proposed design is satisfactory and complies with the intent of the provisions of this Code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this Code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction is not approved, the Head of Works shall respond in writing, stating the reasons why the alternative was not approved.

1.4.11.1 Research reports.

Supporting data, where necessary to assist in the approval of materials or assemblies not specifically provided for in this Code, shall consist of valid research reports from approved sources.

1.4.11.2 Tests.

Whenever there is insufficient evidence of compliance with the provisions of this Code, or evidence that a material or method does not conform to the requirements of this Code, or in order to substantiate claims for alternative materials or methods, the Head of Works shall have the authority to require tests as evidence of compliance to be made without expense to the jurisdiction. Test methods shall be as specified in this Code or by other recognized test standards. In the absence of recognized and accepted test methods, the Head of Works shall approve the testing procedures. Tests shall be performed by an approved agency. Reports of such tests shall be retained by the Head of Works for the period required for retention of public records.

1.5 VALIDITY

1.5.1 Partial Invalidity

In the event any part or provision of this Code is held to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions thereof, which may or shall be determined to be legal, and it shall be presumed that the Code would have been passed without such illegal or invalid parts or provisions.
1.5.2 Segregation of Invalid Provisions

Any invalid part of the Code shall be segregated from the remainder of the Code by the court holding such part invalid, and the remainder shall remain effective.

1.5.3 Decisions involving Existing Buildings

The invalidity of any provision in any clause of the Code as applied to existing buildings and structures shall not be held to affect the validity of such clause in its application to buildings hereafter erected.

1.6 PERMITS

1.6.1 Required Permits.

Any owner or owner’s authorized agent who intends to construct, enlarge, alter, repair, move, demolish or change the occupancy of a building or structure, or to erect, install, enlarge, alter, repair, remove, convert or replace any electrical, gas, mechanical or plumbing system, the installation of which is regulated by this Code, or to cause any such work to be performed, shall first make application to the Local Authority (MMDAs) to obtain the required permit.

1.6.1.1 An occupancy permit is required:

(a) to allow the occupancy of a building or part thereof;
(b) when occupancy of a building or part thereof is changed.

1.6.1.2 Annual permit records.

The person to whom an annual permit is issued shall keep a detailed record of alterations made under such annual permit. The Head of Works shall have access to such records at all times or such records shall be filed with the Head of Works as designated.

1.6.2 Work exempt from permit.

Exemptions from permit requirements of this Code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this Code or legislation. Permits shall not be required for the following:

Building:

1. One-storey detached accessory structures used as tool and storage sheds, playhouses and similar uses, provided that the floor area is not greater than $11 \text{m}^2$ (120 square feet).

2. Sidewalks and driveways not more than 762 mm (30 inches) above adjacent grade, and not over any basement or storey below and are not part of an accessible route.

3. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work for dwelling units.

4. Prefabricated swimming pools accessory to a Group R-3 occupancy that are less than 610 mm (24 inches) deep, are not greater than 18 925 L (5,000 gallons) and are installed entirely above ground.

5. Shade cloth structures constructed for nursery or agricultural purposes, not including service systems.

6. Swings and other playground equipment accessory to detached one- and two-family dwellings.

7. Window awnings in Group R-3 and U occupancies, supported by an exterior wall that do not project more than 1372 mm (54 inches) from the exterior wall and do not require additional support.

8. Nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 1753 mm (9 inches) in height.

1.6.3 The operational construction of the Government, whether temporary or permanent,
which is necessary for the operation, maintenance, development or execution of any of the following services may be exempt from the point of view of this Code:

(a) Railways;
(b) National highways;
(c) National waterways;
(d) Major ports;
(e) Airways and aerodromes;
(f) Posts, telephones, wireless, broadcasting and other like forms of communications;
(g) Regional grid for electricity;
(h) Any other service which the Government may, if it is of the opinion that the operation, maintenance, development or execution of such service is essential to the life of the community, by notification, declare to be a service for the purpose of this clause.
(i) In relation to special constructions exemptions, Buildings that do not require construction permits shall need planning permit.

Electrical:

1. Repairs and maintenance: Minor repair work, including the replacement of lamps or the connection of approved portable electrical equipment to approved permanently installed receptacles.

2. Temporary testing systems: A permit shall not be required for the installation of any temporary system required for the testing or servicing of electrical equipment or apparatus.

Gas:

1. Replacement of any minor part that does not alter approval of equipment or make such equipment unsafe.

Mechanical:

1. Portable ventilation equipment.

2. Portable cooling unit.

3. Steam, hot or chilled water piping within any heating or cooling equipment regulated by this Code.

4. Replacement of any part that does not alter its approval or make it unsafe.

5. Portable evapourative cooler.

6. Self-contained refrigeration system containing 4.54 kg (10 pounds) or less of refrigerant and actuated by motors of 0.75 kW (1 horsepower) or less.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe, provided, however, that if any concealed trap, drain pipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a permit shall be obtained and inspection made as provided in this Code.

2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures and the removal and reinstallation of water closets, provided that such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

1.6.3.1 Emergency repairs.
Where equipment replacements and repairs must be performed in an emergency situation, the permit application shall be submitted within the next working business day to the Head of Works.

1.6.3.2 Public service agencies.
A permit shall not be required for the installation, alteration or repair of generation, transmission, distribution or metering or other related equipment that is under the ownership
and control of public service agencies by established right.

1.6.3.3 Application for permit.
To obtain a permit, the applicant shall first file an application therefore in writing on a form furnished by the department of building safety for that purpose. Such application shall:

1. Identify and describe the work to be covered by the permit for which application is made.
2. Describe the land on which the proposed work is to be done by legal description, street address or similar description that will readily identify and definitely locate the proposed building or work.
3. Indicate the use and occupancy for which the proposed work is intended.
4. Be accompanied by construction documents and other information as required in Clause 1.9
5. State the valuation of the proposed work.
6. Be signed by the applicant, or the applicant’s authorized agent.
7. Give such other data and information as required by the Head of Works.

1.6.3.4 Action on application.
The Head of Works shall examine or cause to be examined applications for permits and amendments thereto within a reasonable time after filing. If the application or the construction documents do not conform to the requirements of pertinent of this Code the Head of Works shall reject such application in writing, stating the reasons therefore. If the Head of Works is satisfied that the proposed work conforms to the requirements of this Code and legislation applicable thereto, the Head of Works shall issue a permit therefore as soon as practicable.

1.6.3.5 Time limitation of application.
An application for a permit for any proposed work shall be deemed to have been abandoned 180 days after the date of filing, unless such application has been pursued in good faith or a permit has been issued; except that the Head of Works is authorized to grant one or more extensions of time for additional periods not exceeding 90 days each. The extension shall be requested in writing and justifiable cause demonstrated.

1.6.4 Validity of permit.
The issuance or granting of a permit shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this Code or of any other ordinance of the jurisdiction. Permits presuming to give authority to violate or cancel the provisions of this Code or other ordinances of the jurisdiction shall not be valid. The issuance of a permit based on construction documents and other data shall not prevent the Head of Works from requiring the correction of errors in the construction documents and other data. The Head of Works is authorized to prevent occupancy or use of a structure where in violation of this Code or of any other ordinances of this jurisdiction.

1.6.5 Expiration.
Every permit issued shall become invalid unless the work on the site authorized by such permit is commenced within 180 days after its issuance, or if the work authorized on the site by such permit is suspended or abandoned for a period of 180 days after the time the work is commenced. The Head of Works is authorized to grant, in writing, one or more extensions of time, for periods not more than 180 days each. The extension shall be requested in writing and justifiable cause demonstrated.

1.6.6 Suspension or revocation.
The Head of Works is authorized to suspend or revoke a permit issued under the provisions of this Code wherever the permit is issued in error or on the basis of incorrect, inaccurate or incomplete information, or in violation of any ordinance or regulation or any of the provisions of this Code.

1.6.7 Placement of permit.
The building permit or copy shall be kept on the site of the work until the completion of the project.

1.6.8 Permit for a Temporary Building
Notwithstanding anything contained elsewhere in this Code, a permit for a temporary building
may be issued by the authority having jurisdiction, authorizing for a limited time only the erection and existence of a building or part thereof for an occupancy which because of its nature will exist for a short time under circumstances which warrant only selective compliance with the provisions of this Code. Refer to clause 1.5.2 for the exception to this requirement.

1.6.8.1 A permit for a temporary building shall state the date after which and the conditions under which the permit is no longer valid.

1.6.8.2 A permit for a temporary building may be extended provided permission in writing is granted by the authority having jurisdiction.

1.6.8.3 A permit for a temporary building shall be posted on the building.

1.7 DEMOLITION OF BUILDING

Before a building is demolished, the owner shall notify all utilities having service connections within the building, such as water, electric, gas sewer and other connections. A permit to demolish a building shall not be issued until a release is obtained from the utilities stating that their respective service connections and appurtenant equipment such as meters and regulators have been removed or sealed and plugged in a safe manner.

1.8 FLOOR AND ROOF DESIGN LOADS

1.8.1 Live loads posted.

In commercial or industrial buildings, for each floor or portion thereof designed for live loads exceeding 2.40 kN/m² (50 psf), such design live loads shall be conspicuously posted by the owner or the owner’s authorized agent in that part of each storey in which they apply, using durable signs. It shall be unlawful to remove or deface such notices.

1.8.2 Issuance of certificate of occupancy.

A certificate of occupancy required by Clause 1.13 shall not be issued until the floor load signs, required by this Code, have been installed.

1.8.3 Restrictions on loading.

It shall be unlawful to place, or cause or permit to be placed, on any floor or roof of a building, structure or portion thereof, a load greater than is permitted by this Code.

1.9 SUBMISSION DOCUMENTS

1.9.1 General.

Submission documents consisting of construction documents, statement of special inspections, geotechnical report and other data shall be submitted with the required sets with each permit application. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the Head of Works is authorized to require additional construction documents to be prepared by a registered design professional.

1.9.2 Construction documents.

Construction documents shall be in accordance with Clauses 1.9.2.1 through 1.9.2.8.

1.9.2.1 Information on construction documents.

Construction documents shall be dimensioned and drawn on suitable material. Electronic media documents are permitted to be submitted where approved by the Head of Works. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this Code and relevant legislation, rules and regulations, as determined by the Head of Works.

1.9.2.1.1 Additional Information accompanying Notice

Except otherwise allowed by the authority having jurisdiction every application shall:

(a) identify and describe in detail the work and occupancy to be covered by the permit for which application is made;

(b) describe land on which the work is to be done, by a description that
will readily identify and locate the building/plot;

(c) include plans and specifications, unless otherwise approved by the authority having jurisdiction, and show the occupancy of all parts of the building;

(d) state the cost of the proposed work, and be accompanied by the required fee;

(e) state the names, addresses and telephone numbers of the owner, architect, engineer or other designer and constructor;

(f) in the case of building plans for multi-storey/special buildings (that is, buildings that are more than 15m in height and for special buildings like educational, assembly, institutional, industrial, storage and hazardous and mixed occupancies having area more than 500m²), require the following additional information, as applicable;

(i) access to fire appliances/vehicles with details of vehicular turning circle and clear motorable accessway around the building;
(ii) width of main and alternative staircases along with balcony approach, corridor, ventilated lobby approach;
(iii) location and details of lift enclosures;
(iv) location and size of fire lift;
(v) smoke stop lobby/door, where provided;
(vi) refuse chutes, refuse chamber, service duct, etc;
(vii) vehicular parking spaces;
(viii) refuse area, if any;
(ix) details of building services.

1.9.2.2 Fire protection system shop drawings.

Shop drawings for the fire protection system(s) shall be submitted to indicate conformance to this Code and the construction documents and shall be approved prior to the start of system installation. Shop drawings shall contain all information as required by the referenced installation standards in Part 9.

1.9.2.3 Means of escape.

The construction documents shall show in sufficient detail the location, construction, size and character of all portions of the means of escape including the path of the exit discharge to the public way in compliance with the provisions of this Code. In other than occupancies in Groups R-2, R-3, and I-1, the construction documents shall designate the number of occupants to be accommodated on every floor, and in all rooms and spaces.

1.9.2.4 Exterior wall envelope.

Construction documents for all buildings shall describe the exterior wall envelope in sufficient detail to determine compliance with this Code. The construction documents shall provide details of the exterior wall envelope as required, including flashing, interclauses with dissimilar materials, corners, end details, control joints, interclauses at roof, eaves or parapets, means of drainage, water-resistive membrane and details around openings. The construction documents shall include manufacturer’s installation instructions that provide supporting documentation that the proposed penetration and opening details described in the construction documents maintain the weather resistance of the exterior wall envelope. The supporting documentation shall fully describe the exterior wall system that was tested, where applicable, as well as the test procedure used.

1.9.2.5 Exterior balconies and elevated walking surfaces.

Where balconies or other elevated walking surfaces are exposed to water from direct or blowing rain, snow, or irrigation, and the structural framing is protected by an impervious moisture barrier, the construction documents shall include details for all elements of the impervious moisture barrier system. The construction documents shall include manufacturer’s installation instructions.

1.9.2.6 Site plan.

The construction documents submitted with the application for permit shall be accompanied by a site plan showing to scale the size and
location of new construction and existing structures on the site, distances from plot lines, the established street grades and the proposed finished grades and, as applicable, flood hazard areas, floodways, and design flood elevations; and it shall be drawn in accordance with an accurate boundary line survey. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot. The Head of Works is authorized to waive or modify the requirement for a site plan where the application for permit is for alteration or repair or where otherwise warranted.

1.9.2.6.1 Design flood elevations.
Where design flood elevations are not specified, they shall be established in accordance with this Code.

1.9.2.7 Structural information.
The construction documents shall provide the information specified in this Code.

1.9.2.8 Relocatable buildings.
Construction documents for relocatable buildings shall comply with this Code.

1.9.3 Examination of documents.
The Head of Works shall examine or cause to be examined the accompanying Submission documents and shall ascertain by such examinations whether the construction indicated and described is in accordance with the requirements of this Code or legislation.

1.9.3.1 Approval of construction documents.
When the Head of Works issues a permit, the construction documents shall be approved, in writing or by stamp, as “Reviewed for Code Compliance.” One set of construction documents so reviewed shall be retained by the Head of Works. The other set shall be returned to the applicant, shall be kept at the site of work and shall be open to inspection by the Head of Works or a duly authorized representative.

1.9.3.2 Previous approvals.
This Code shall not require changes in the construction documents, construction or designated occupancy of a structure for which a lawful permit has been heretofore issued or otherwise lawfully authorized, and the construction of which has been pursued in good faith within 180 days after the effective date of this Code and has not been abandoned.

1.9.3.3 Phased approval.
The Head of Works is authorized to issue a permit for the construction of foundations or any other part of a building or structure before the construction documents for the whole building or structure have been submitted, provided that adequate information and detailed statements have been filed complying with pertinent requirements of this Code. The holder of such permit for the foundation or other parts of a building or structure shall proceed at the holder’s own risk with the building operation and without assurance that a permit for the entire structure will be granted.

1.9.3.4 Design professional in responsible charge.
Where it is required that documents be prepared by a registered design professional, the Head of Works shall be authorized to require the owner or the owner’s authorized agent to engage and designate on the building permit application a registered design professional who shall act as the registered design professional in responsible charge. If the circumstances require, the owner or the owner’s authorized agent shall designate a substitute registered design professional in responsible charge who shall perform the duties required of the original registered design professional in responsible charge. The Head of Works shall be notified in writing by the owner or the owner’s authorized agent if the registered design professional in responsible charge is changed or is unable to continue to perform the duties.

The registered design professional in responsible charge shall be responsible for reviewing and coordinating Submission documents prepared by others, including phased and deferred Submission items, for compatibility with the design of the building.
1.9.3.4.1 Deferred Submissions.

Deferral of any Submission items shall have the prior approval of the Head of Works. The registered design professional in responsible charge shall list the deferred Submissions on the construction documents for review by the Head of Works.

Documents for deferred Submission items shall be submitted to the registered design professional in responsible charge who shall review them and forward them to the Head of Works with a notation indicating that the deferred Submission documents have been reviewed and found to be in general conformance to the design of the building. The deferred Submission items shall not be installed until the deferred Submission documents have been approved by the Head of Works.

1.9.4 Amended construction documents.

Work shall be installed in accordance with the approved construction documents, and any changes made during construction that are not in compliance with the approved construction documents shall be resubmitted for approval as an amended set of construction documents.

1.9.5 Retention of construction documents.

One set of approved construction documents shall be retained by the Head of Works for a period of not less than 180 days from date of completion of the permitted work, or as required by this Code.

1.10 TEMPORARY STRUCTURES AND USES

1.10.1 General.

The Head of Works is authorized to issue a permit for temporary structures and temporary uses. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The Head of Works is authorized to grant extensions for demonstrated cause.

1.10.2 Conformance.

Temporary structures and uses shall comply with the requirements in this Code.

1.10.3 Temporary power.

The Head of Works is authorized to give permission to temporarily supply and use power in part of an electric installation before such installation has been fully completed and the final certificate of completion has been issued. The part covered by the temporary certificate shall comply with the requirements specified for temporary lighting, heat or power in Ghana Wiring Code.

1.10.4 Termination of approval.

The Head of Works is authorized to terminate such permit for a temporary structure or use and to order the temporary structure or use to be discontinued.

1.11 FEES

1.11.1 Payment of fees.

A permit shall not be valid until the fees prescribed by law have been paid, nor shall an amendment to a permit be released until the additional fee, if any, has been paid.

1.11.2 Schedule of permit fees.

On buildings, structures, electrical, gas, mechanical, and plumbing systems or alterations requiring a permit, a fee for each permit shall be paid as required, in accordance with the schedule as established by the applicable governing authority.

1.11.3 Building permit valuations.

The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work, including materials and labor, for which the permit is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. If, in the opinion of the Head of Works, the valuation is underestimated on the application, the permit shall be denied, unless the applicant can show detailed estimates to meet the approval of the Head of Works. Final building permit valuation shall be set by the Head of Works.
1.11.4 Work commencing before permit issuance.
Any person who commences any work on a building, structure, electrical, gas, mechanical or plumbing system before obtaining the necessary permits shall be subject to a fee established by the Head of Works that shall be in addition to the required permit fees.

1.11.5 Related fees.
The payment of the fee for the construction, alteration, removal or demolition for work done in connection to or concurrently with the work authorized by a building permit shall not relieve the applicant or holder of the permit from the payment of other fees that are prescribed by law.

1.11.6 Refunds.
The Head of Works is authorized to establish a refund policy.

1.12 INSPECTIONS
1.12.1 General.
Construction or work for which a permit is required shall be subject to inspection by the Head of Works and such construction or work shall remain visible and able to be accessed for inspection purposes until approved. Approval as a result of an inspection shall not be construed to be an approval of a violation of the provisions of this Code or of other ordinances of the jurisdiction. Inspections presuming to give authority to violate or cancel the provisions of this Code or of other ordinances of the jurisdiction shall not be valid. It shall be the duty of the owner or the owner's authorized agent to cause the work to remain visible and able to be accessed for inspection purposes. Neither the Head of Works nor the jurisdiction shall be liable for expense entailed in the removal or replacement of any material required to allow inspection.

1.12.2 Preliminary inspection.
Before issuing a permit, the Head of Works is authorized to examine or cause to be examined buildings, structures and sites for which an application has been filed.

1.12.3 Required inspections.
The Head of Works, upon notification, shall make the inspections set forth in Clauses 1.12.3.1 through 1.12.3.11.

1.12.3.1 Footing and foundation inspection.
Footing and foundation inspections shall be made after excavations for footings are complete and any required reinforcing steel is in place. For concrete foundations, any required forms shall be in place prior to inspection. Materials for the foundation shall be on the job, except where concrete is ready mixed in accordance with ASTM C94, the concrete need not be on the job.

1.12.3.2 Concrete slab and under-floor inspection.
Concrete slab and under-floor inspections shall be made after in-slab or under-floor reinforcing steel and building service equipment, conduit, piping accessories and other ancillary equipment items are in place, but before any concrete is placed or floor sheathing installed, including the subfloor.

1.12.3.3 Lowest floor elevation.
In flood hazard areas, upon placement of the lowest floor, including the basement, and prior to further vertical construction, the elevation certification required in this Code shall be submitted to the Head of Works.

1.12.3.4 Frame inspection.
Framing inspections shall be made after the roof deck or sheathing, all framing, fire-blocking and bracing are in place and pipes, chimneys and vents to be concealed are complete and the rough electrical, plumbing, heating wires, pipes and ducts are approved.
1.12.3.5 Lath, gypsum board and gypsum panel product inspection.

Lath, gypsum board and gypsum panel product inspections shall be made after lathing, gypsum board and gypsum panel products, interior and exterior, are in place, but before any plastering is applied or gypsum board and gypsum panel product joints and fasteners are taped and finished.

**Exception:** Gypsum board and gypsum panel products that are not part of a fire-resistance-rated assembly or a shear assembly.

1.12.3.6 Weather-exposed balcony and walking surface waterproofing.

Where balconies or other elevated walking surfaces are exposed to water from direct or blowing rain, snow or irrigation, and the structural framing is protected by an impervious moisture barrier, all elements of the impervious moisture barrier system shall not be concealed until inspected and approved.

**Exception:** Where special inspections are provided in accordance with this Code.

1.12.3.7 Fire- and smoke-resistant penetrations.

Protection of joints and penetrations in fire-resistance-rated assemblies, smoke barriers and smoke partitions shall not be concealed from view until inspected and approved.

1.12.3.8 Energy efficiency inspections.

Inspections shall be made to determine compliance with Part 14 and shall include, but not be limited to, inspections for: envelope insulation R- and U-values, fenestration U-value, duct system R-value, and HVAC and water-heating equipment efficiency.

1.12.3.9 Other inspections.

In addition to the inspections specified in Clauses 1.12.3.1 through 1.12.3.8, the Head of Works is authorized to make or require other inspections of any construction work to ascertain compliance with the provisions of this Code that are enforced by the department of building safety.

1.12.3.10 Special inspections.

For special inspections, see Part 19.

1.12.3.11 Final inspection.

The final inspection shall be made after all work required by the building permit is completed.

1.12.3.11.1 Flood hazard documentation.

If located in a flood hazard area, documentation of the elevation of the lowest floor as required in this Code shall be submitted to the Head of Works prior to the final inspection.

1.12.4 Inspection agencies.

The Head of Works is authorized to accept reports of approved inspection agencies, provided that such agencies satisfy the requirements as to qualifications and reliability.

1.12.5 Inspection requests.

It shall be the duty of the holder of the building permit or their duly authorized agent to notify the Head of Works when work is ready for inspection. It shall be the duty of the permit holder to provide access to and means for inspections of such work that are required by this Code.

1.12.6 Approval required.

Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the Head of Works. The Head of Works, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this Code. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the Head of Works.
1.13 CERTIFICATE OF OCCUPANCY

1.13.1 Change of occupancy.

A building or structure shall not be used or occupied, and a change of occupancy of a building or structure or portion thereof shall not be made, until the Head of Works has issued a certificate of occupancy therefore as provided herein. Issuance of a certificate of occupancy shall not be construed as an approval of a violation of the provisions of this Code or legislation.

Exception: Certificates of occupancy are not required for work exempt from permits in accordance with this Code.

1.13.2 Certificate issued.

After the Head of Works inspects the building or structure and does not find violations of the provisions of this Code that are enforced by the department of building safety, the Head of Works shall issue a certificate of occupancy that contains the following:

1. The building permit number.
2. The address of the structure.
3. The name and address of the owner or the owner’s authorized agent.
4. A description of that portion of the structure for which the certificate is issued.
5. A statement that the described portion of the structure has been inspected for compliance with the requirements of this Code for the occupancy and division of occupancy and the use for which the proposed occupancy is classified.
6. The name of the Head of Works.
7. The edition of the Code under which the permit was issued.
8. The use and occupancy, in accordance with the provisions of Part 3.
9. The type of construction as defined in Part 7.
10. The design occupant load.
11. If an automatic sprinkler system is provided, whether the sprinkler system is required.
12. Any special stipulations and conditions of the building permit.

1.13.3 Temporary occupancy.

The Head of Works is authorized to issue a temporary certificate of occupancy before the completion of the entire work covered by the permit, provided that such portion or portions shall be occupied safely. The Head of Works shall set a time period during which the temporary certificate of occupancy is valid.

1.13.4 Revocation.

The Head of Works is authorized to, in writing, suspend or revoke a certificate of occupancy or completion issued under the provisions of this Code wherever the certificate is issued in error, or on the basis of incorrect information supplied, or where it is determined that the building or structure or portion thereof is in violation of any ordinance or regulation or any of the provisions of this Code.

1.14 SERVICE UTILITIES

1.14.1 Connection of service utilities.

A person shall not make connections from a utility, source of energy, fuel or power to any building or system that is regulated by this Code for which a permit is required, until released by the Head of Works.

1.14.2 Temporary connection.

The Head of Works shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel or power.

1.14.3 Authority to disconnect service utilities.

The Head of Works shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this Code and the referenced Codes and standards set forth in Clause 1.1.4 in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility
connection has been made without the approval required by Clause 1.14.1 or 1.14.2. The Head of Works shall notify the serving utility, and wherever possible the owner and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

1.15 BOARD OF APPEALS

1.15.1 General.

In order to hear and decide appeals of orders, decisions or determinations made by the Head of Works relative to the application and interpretation of this Code, there shall be a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business.

1.15.2 Limitations on authority.

An application for appeal shall be based on a claim that the true intent of this Code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this Code do not fully apply or an equally good or better form of construction is proposed. The board shall not have authority to waive requirements of this Code.

1.15.3 Qualifications.

The board of appeals shall consist of members who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

1.15.4 The Board of Appeal shall consist of at least 7 members, each with a minimum of 15 years professional experience and good standing members of the Ghana Institute of Architects, Ghana Institute of Planners, Ghana Institution of Engineering and the Ghana Institution of Surveyors, plus other members from other government agencies (e.g. Ghana National Fire Service, Environmental Protection Agency, etc.)

1.16 VIOLATIONS

1.16.1 Unlawful acts.

It shall be unlawful for any person, firm or corporation to erect, construct, alter, extend, repair, move, remove, demolish or occupy any building, structure or equipment regulated by this Code, or cause same to be done, in conflict with or in violation of any of the provisions of this Code.

1.16.2 Notice of violation.

The Head of Works is authorized to serve a notice of violation or order on the person responsible for the erection, construction, alteration, extension, repair, moving, removal, demolition or occupancy of a building or structure in violation of the provisions of this Code, or in violation of a permit or certificate issued under the provisions of this Code. Such order shall direct the discontinuance of the illegal action or condition and the abatement of the violation.

1.16.3 Prosecution of violation.

If the notice of violation is not complied with promptly, the Head of Works is authorized to request the legal counsel of the jurisdiction to institute the appropriate proceeding at law or in equity to restrain, correct or abate such violation, or to require the removal or termination of the unlawful occupancy of the building or structure in violation of the provisions of this Code or of the order or direction made pursuant thereto.

1.16.4 Violation penalties.

Any person who violates a provision of this Code or fails to comply with any of the requirements thereof or who erects, constructs, alters or repairs a building or structure in violation of the approved construction documents or directive of the Head of Works, or of a permit or certificate issued under the provisions of this Code, shall be subject to penalties as prescribed by law.
1.17 STOP WORK ORDER

1.17.1 Authority.

Where the Head of Works finds any work regulated by this Code being performed in a manner either contrary to the provisions of this Code or dangerous or unsafe, the Head of Works is authorized to issue a stop work order.

1.17.2 Issuance.

The stop work order shall be in writing and shall be given to the owner of the property involved, the owner's authorized agent or the person performing the work. Upon issuance of a stop work order, the cited work shall immediately cease. The stop work order shall state the reason for the order and the conditions under which the cited work will be permitted to resume.

1.17.3 Unlawful continuance.

Any person who shall continue any work after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be subject to penalties as prescribed by law.

1.18 UNSAFE STRUCTURES AND EQUIPMENT

1.18.1 Conditions.

Structures or existing equipment that are or hereafter become unsafe, insanitary or deficient because of inadequate means of escape facilities, inadequate light and ventilation, or that constitute a fire hazard, or are otherwise dangerous to human life or the public welfare, or that involve illegal or improper occupancy or inadequate maintenance, shall be deemed an unsafe condition. Unsafe structures shall be taken down and removed or made safe, as the Head of Works deems necessary and as provided for in this clause. A vacant structure that is not secured against entry shall be deemed unsafe.

1.18.2 Record.

The Head of Works shall cause a report to be filed on an unsafe condition. The report shall state the occupancy of the structure and the nature of the unsafe condition.

1.18.3 Notice.

If an unsafe condition is found, the Head of Works shall serve on the owner, agent or person in control of the structure, a written notice that describes the condition deemed unsafe and specifies the required repairs or improvements to be made to abate the unsafe condition, or that requires the unsafe structure to be demolished within a stipulated time. Such notice shall require the person thus notified to declare immediately to the Head of Works acceptance or rejection of the terms of the order.

1.18.4 Method of service.

Such notice shall be deemed properly served if a copy thereof is: delivered to the owner personally; sent by certified or registered mail addressed to the owner at the last known address with the return receipt requested; or delivered in any other manner as prescribed by local law. If the certified or registered letter is returned showing that the letter was not delivered, a copy thereof shall be posted in a conspicuous place in or about the structure affected by such notice. Service of such notice in the foregoing manner on the owner's agent or on the person responsible for the structure shall constitute service of notice on the owner.

1.18.5 Restoration.

Where the structure or equipment determined to be unsafe by the Head of Works is restored to a safe condition, to the extent that repairs, alterations or additions are made or a change of occupancy occurs during the restoration of the structure, such repairs, alterations, additions and change of occupancy shall comply with the requirements of the International Existing Building Code.
PART 2: DEFINITIONS

User notes:

About this part: Codes, by their very nature, are technical documents. Every word, term and punctuation mark can add to or change the meaning of a technical requirement. It is necessary to maintain a consensus on the specific meaning of each term contained in the Code. Part 2 performs this function by stating clearly what specific terms mean for the purpose of the Code.

2.1 GENERAL

2.1.1 Scope.

Unless otherwise expressly stated, the following words and terms shall, for the purposes of this Code, have the meanings shown in this part.

2.1.2 Interchangeability.

Words used in the present tense include the future; words stated in the masculine gender include the feminine and neuter; the singular number includes the plural and the plural, the singular.

2.1.3 Terms defined in other Codes.

Where terms are not defined in this Code and are defined in the Ghana Fire Code such terms shall have the meanings ascribed to them as in those Codes.

2.1.4 Terms not defined.

Where terms are not defined through the methods authorized by this clause, such terms shall have ordinarily accepted meanings such as the context implies.

2.2 DEFINITIONS

24-HOUR BASIS. The actual time that a person is an occupant within a facility for the purpose of receiving care. It shall not include a facility that is open for 24 hours and is capable of providing care to someone visiting the facility during any segment of the 24 hours.

AAC MASONRY. Masonry made of autoclaved aerated concrete (AAC) units, manufactured without internal reinforcement and bonded together using thin- or thick-bed mortar.

ACCESS. The portion that provides the means or right to enter

ACCESSIBLE. A site, building, facility or portion thereof that complies with Part 12.

ACCESSIBLE MEANS OF ESCAPE. A continuous and unobstructed way of escape travel from any accessible point in a building or facility to a public way.

ACCESSIBLE ROUTE. A continuous, unobstructed path that complies with Part 12.

ACCESSIBLE UNIT. A dwelling unit or sleeping unit that complies with this Code and the provisions for Accessible units in GS 1119.

ACCREDITATION BODY. An approved, third-party organization that is independent of the grading and inspection agencies, and the timber mills, and that initially accredits and subsequently monitors, on a continuing basis, the competency and performance of a grading or inspection agency related to carrying out specific tasks.

ADDITION. An extension or increase in floor area, number of stories or height of a building or structure.

ADHERED MASONRY VENEER. Veneer secured and supported through the adhesion of an approved bonding material applied to an approved backing.

ADOBE CONSTRUCTION. Construction in which the exterior load-bearing and nonload-bearing walls and partitions are of unfired clay masonry units, and floors, roofs and interior framing are wholly or partly of wood or other approved materials.

Adobe, stabilized. Unfired clay masonry units to which admixtures, such as emulsified asphalt, are added during the manufacturing process to limit the units’ water absorption so as to increase their durability.

Adobe, unstabilized. Unfired clay masonry units that do not meet the definition of “Adobe, stabilized.”

AEROSOL CONTAINER. A metal can or plastic container up to a maximum size of 33.8 fluid ounces (1000 ml), or a glass bottle up to a maximum size of 4 fluid ounces (118 ml), designed and intended to dispense an aerosol.

AEROSOL PRODUCT. A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical
heats of combustion and shall be designated Level 1, Level 2 or Level 3.

**Level 1 aerosol products.** Those with a total chemical heat of combustion that is less than or equal to 8,600 British thermal units per pound (Btu/lb) (20 kJ/g).

**Level 2 aerosol products.** Those with a total chemical heat of combustion that is greater than 8,600 Btu/lb (20 kJ/g), but less than or equal to 13,000 Btu/lb (30 kJ/g).

**Level 3 aerosol products.** Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g).

**AGRICULTURAL BUILDING.** A structure designed and constructed to house farm implements, hay, grain, poultry, livestock or other horticultural products. This structure shall not be a place of human habitation or a place of employment where agricultural products are processed, treated or packaged, nor shall it be a place used by the public.

**AIR-IMPERMEABLE INSULATION.** An insulation having an air permeance equal to or less than 0.02 l/s × m2 at 75 pa pressure differential tested in accordance with ASTM E2178 or ASTM E283.

**AIR-INFLATED STRUCTURE.** A structure that uses air-pressurized membrane beams, arches or other elements to enclose space. Occupants of such a structure do not occupy the pressurized area used to support the structure.

**AIR-SUPPORTED STRUCTURE.** A structure wherein the shape of the structure is attained by air pressure and occupants of the structure are within the elevated pressure area. Air-supported structures are of two basic types:

- **Double skin.** Similar to a single skin, but with an attached liner that is separated from the outer skin and provides an airspace which serves for insulation, acoustic, aesthetic or similar purposes.

- **Single skin.** Where there is only the single outer skin and the air pressure is directly against that skin.

**AISLE.** An unenclosed exit access component that defines and provides a path of escape travel.

**AISLE ACCESSWAY.** That portion of an exit access that leads to an aisle.

**ALARM NOTIFICATION APPLIANCE.** A fire alarm system component such as a bell, horn, speaker, light or text display that provides audible, tactile or visible outputs, or any combination thereof.

**ALARM SIGNAL.** A signal indicating an emergency requiring immediate action, such as a signal indicative of fire.

**ALARM VERIFICATION FEATURE.** A feature of automatic fire detection and alarm systems to reduce unwanted alarms wherein smoke detectors report alarm conditions for a minimum period of time, or confirm alarm conditions within a given time period, after being automatically reset, in order to be accepted as a valid alarm-initiation signal.

**ALLOWABLE STRESS DESIGN.** A method of proportioning structural members, such that elastically computed stresses produced in the members by nominal loads do not exceed specified allowable stresses produced in the structure.

**ALTERNATION.** Any construction or renovation to an existing structure other than repair or addition.

**AMBULATORY CARE FACILITY.** Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than 24-hour basis to persons who are rendered incapable of self-preservation by the services provided or staff has accepted responsibility for care recipients already incapable.

**ANCHOR BUILDING.** An exterior perimeter building of a group other than H having direct access to a covered or open mall building but having required means of escape independent of the mall.

**ANCHORED MASONRY FINISH.** Finish secured with approved mechanical fasteners to an approved backing.

**ANNULAR SPACE.** The opening around the penetrating item.

**ANNUNCIATOR.** A unit containing one or more indicator lamps, alphanumeric displays or other equivalent means in which each indication provides status information about a circuit, condition or location.

**APPROVED.** Acceptable to the Head of Works.

**APPROVED AGENCY.** An established and recognized agency that is regularly engaged in conducting tests, furnishing inspection services or furnishing product certification where such
agency has been approved by the Head of Works.

APPROVED FABRICATOR. An established and qualified person, firm or corporation approved by the Head of Works pursuant to Part 19 of this Code.

APPROVED SOURCE. An independent person, firm or corporation, approved by the Head of Works, who is competent and experienced in the application of engineering principles to materials, methods or systems analyses.

AREA, BUILDING. The area included within surrounding exterior walls, or exterior walls and fire walls, exclusive of vent shafts and courts. Areas of the building not provided with surrounding walls shall be included in the building area if such areas are included within the horizontal projection of the roof or floor above.

AREA OF REFUGE. An area where persons unable to use stairways can remain temporarily to await instructions or assistance during emergency evacuation.

AREA OF SPORT ACTIVITY. That portion of an indoor or outdoor space where the play or practice of a sport occurs.

AREAWAY. A subsurface space adjacent to a building open at the top or protected at the top by a grating or guard.

ATRIUM. An opening connecting two or more stories other than enclosed stairways, elevators, hoistways, escalators, plumbing, electrical, air-conditioning or other equipment, which is closed at the top and not defined as a mall. Stories, as used in this definition, do not include balconies within assembly groups or mezzanines that comply with this Code.

ATTIC. The space between the ceiling framing of the top storey and the underside of the roof.

AUDIBLE ALARM NOTIFICATION APPLIANCE. A notification appliance that alerts by the sense of hearing.

AUTOMATIC. As applied to fire protection devices, a device or system providing an emergency function without the necessity for human intervention and activated as a result of a predetermined temperature rise, rate of temperature rise or combustion products.

AUTOMATIC FIRE-EXTINGUISHING SYSTEM. An approved system of devices and equipment which automatically detects a fire and discharges an approved fire-extinguishing agent onto or in the area of a fire.

AUTOMATIC SMOKE DETECTION SYSTEM. A fire alarm system that has initiation devices that utilize smoke detectors for protection of an area such as a room or space with detectors to provide early warning of fire.

AUTOMATIC SPRINKLER SYSTEM. An automatic sprinkler system, for fire protection purposes, is an integrated system of underground and overhead piping designed in accordance with fire protection engineering standards.

AUTOMATIC WATER MIST SYSTEM. A system consisting of a water supply, a pressure source and a distribution piping system with attached nozzles, which, at or above a minimum operating pressure defined by its listing, discharges water in fine droplets meeting the requirements of Ghana Fire Code for the purpose of the control, suppression or extinguishment of a fire. Such systems include wet-pipe, dry-pipe and preaction types. The systems are designed as engineered, preengineered, local-application or total-flooding systems.

AVERAGE AMBIENT SOUND LEVEL. The root mean square, A-weighted sound pressure level measured over a 24-hour period, or the time any person is present, whichever time period is less.

AWNING. An architectural projection that provides weather protection, identity or decoration and is partially or wholly supported by the building to which it is attached. An awning is comprised of a lightweight frame structure over which a covering is attached.

BACKING. The wall or surface to which the veneer is secured.

BALANCED DOOR. A door equipped with double-pivoted hardware so designed as to cause a semicounterbalanced swing action when opening.

BALLAST. In roofing, ballast comes in the form of large stones or paver systems or light-weight interlocking paver systems and is used to provide uplift resistance for roofing systems that are not adhered or mechanically attached to the roof deck.

BARRICADE. A structure that consists of a combination of walls, floor and roof, which is designed to withstand the rapid release of
energy in an explosion and which is fully confined, partially vented or fully vented; or other effective method of shielding from explosive materials by a natural or artificial barrier.

Artificial barricade. An artificial mound or revetment a minimum thickness of 3 feet (914 mm).

Natural barricade. Natural features of the ground, such as hills, or timber of sufficient density that the surrounding exposures that require protection cannot be seen from the magazine or building containing explosives when the trees are bare of leaves.

BASEMENT (for flood loads). The portion of a building having its floor subgrade (below ground level) on all sides.

BASEMENT. A storey that is not a storey above grade plane

BEARING WALL STRUCTURE. A building or other structure in which vertical loads from floors and roofs are primarily supported by walls.

BED JOINT. The horizontal layer of mortar on which a masonry unit is laid.

BLEACHERS. Tiered seating supported on a dedicated structural system and two or more rows high and is not a building element.

BOARDING HOUSE. A building arranged or used for lodging for compensation, with or without meals, and not occupied as a single-family unit.

BRACED WALL LINE. A straight line through the building plan that represents the location of the lateral resistance provided by the wall bracing.

BRACED WALL PANEL. A full-height clause of wall constructed to resist in-plane shear loads through interaction of framing members, sheathing material and anchors. The panel’s length meets the requirements of its particular bracing method and contributes toward the total amount of bracing required along its braced wall line.

BREAKOUT. For revolving doors, a process whereby wings or door panels can be pushed open manually for means of escape travel.

BRICK. Calcium silicate (sand lime brick). A pressed and subsequently autoclaved unit that consists of sand and lime, with or without the inclusion of other materials.

Clay. A solid or hollow masonry unit of clay, usually formed into a rectangular prism, then burned or fired in a kiln; brick is a ceramic product.

Concrete. A concrete masonry unit made from Portland cement, water, and suitable aggregates, with or without the inclusion of other materials.

BUILDING. Any structure utilized or intended for supporting or sheltering any occupancy.

BUILDING ELEMENT. A fundamental component of building construction, listed in Table 601, which may or may not be of fire-resistance-rated construction and is constructed of materials based on the building type of construction.

BUILDING-INTEGRATED PHOTOVOLTAIC (BIPV) PRODUCT. A building product that incorporates photovoltaic modules and functions as a component of the building envelope

BUILDING-INTEGRATED PHOTOVOLTAIC ROOF PANEL (BIPV ROOF PANEL). A photovoltaic panel that functions as a component of the building envelope.

BUILDING LINE. The line established by law, beyond which a building shall not extend, except as specifically provided by law.

HEAD OF WORKS. The officer or other designated authority charged with the administration and enforcement of this Code, or a duly authorized representative.

BUILT-UP ROOF COVERING. Two or more layers of felt cemented together and surfaced with a cap sheet, mineral aggregate, smooth coating or similar surfacing material.

CABLE-RESTRAINED, AIR-SUPPORTED STRUCTURE. A structure in which the uplift is resisted by cables or webbings which are anchored to either foundations or dead men. Reinforcing cable or webbing is attached by various methods to the membrane or is an integral part of the membrane. This is not a cable-supported structure.

CANOPY. A permanent structure or architectural projection of rigid construction over which a covering is attached that provides weather protection, identity or decoration. A canopy is permitted to be structurally
independent or supported by attachment to a building on one or more sides.

**CAPACITOR ENERGY STORAGE SYSTEM.** A stationary, rechargeable energy storage system consisting of capacitors, chargers, controls and associated electrical equipment designed to provide electrical power to a building or facility. The system is typically used to provide standby or emergency power, an uninterruptable power supply, load shedding, load sharing or similar capabilities.

**Preengineered capacitor energy storage system.** A capacitor energy storage system consisting of capacitors, an energy management system, components and modules that are produced in a factory, designed to constitute the system when assembled and shipped to the job site for assembly.

**Prepackaged capacitor energy storage system.** A capacitor energy storage system consisting of capacitors, an energy management system, components and modules that is factory assembled and then shipped as a complete unit for installation at the job site.

**CARBON DIOXIDE EXTINGUISHING SYSTEMS.** A system supplying carbon dioxide (CO₂) from a pressurized vessel through fixed pipes and nozzles. The system includes a manual- or automatic-actuating mechanism.

**CARBON MONOXIDE ALARM.** A single- or multiple-station alarm intended to detect carbon monoxide gas and alert occupants by a distinct audible signal. It incorporates a sensor, control components and an alarm notification appliance in a single unit.

**CARBON MONOXIDE DETECTOR.** A device with an integral sensor to detect carbon monoxide gas and transmit an alarm signal to a connected alarm control unit.

**CARE SUITE.** In Group I-2 occupancies, a group of treatment rooms, care recipient sleeping rooms and the support rooms or spaces and circulation space within the suite where staff are in attendance for supervision of all care recipients within the suite, and the suite is in compliance with the requirements of this Code.

**CAST STONE.** A building stone manufactured from Portland cement concrete precast and used as a trim, veneer or facing on or in buildings or structures.

**CEILING LIMIT.** The maximum concentration of an airborne contaminant to which one may be exposed.

**CEILING RADIATION DAMPER.** A listed device installed in a ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly to limit automatically the radiative heat transfer through an air inlet/outlet opening. Ceiling radiation dampers include air terminal units, ceiling dampers and ceiling air diffusers.

**CELL (Group I-3 occupancy).** A room within a housing unit in a detention or correctional facility used to confine inmates or prisoners.

**CELL (masonry).** A void space having a gross cross-clause area greater than 11/2 square inches (967 mm²).

**CELL TIER.** Levels of cells vertically stacked above one another within a housing unit.

**CEMENT PLASTER.** A mixture of Portland or blended cement, Portland cement or blended cement and hydrated lime, masonry cement or plastic cement and aggregate and other approved materials as specified in this Code.

**CERAMIC FIBER BLANKET.** A high-temperature mineral wool insulation material made of alumina-silica ceramic or calcium magnesium silicate soluble fibers and weighing 4 to 10 pounds per cubic foot (pcf) (64 to 160 kg/m³).

**CERTIFICATE OF COMPLIANCE.** A certificate stating that materials and products meet specified standards or that work was done in compliance with approved construction documents.

**CHANGE OF OCCUPANCY.** A change in the use of a building or a portion a building which results in one of the following:

1. A change of occupancy classification.
2. A change from one group to another group within an occupancy classification.
3. Any change in use within a group for which there is a change in application of the requirements of this Code.

**CHILDREN’S PLAY STRUCTURE.** A structure composed of one or more components, where the user enters a play environment.
CHIMNEY. A primarily vertical structure containing one or more flues, for the purpose of carrying gaseous products of combustion and air from a fuel-burning appliance to the outdoor atmosphere.

Factory-built chimney. A listed and labeled chimney composed of factory-made components, assembled in the field in accordance with manufacturer's instructions and the conditions of the listing.

Masonry chimney. A field-constructed chimney composed of solid masonry units, bricks, stones, or concrete.

Metal chimney. A field-constructed chimney of metal.

CIRCULATION PATH. An exterior or interior way of passage from one place to another for pedestrians.

CLEAN AGENT. Electrically nonconducting, volatile or gaseous fire extinguishant that does not leave a residue upon vapourisation.

CLIMATE ZONE. A geographical region that has been assigned climatic criteria as specified in Parts 3CE and 3RE of the International Energy Conservation Code.

CLINIC, OUTPATIENT. Buildings or portions thereof used to provide medical care on less than a 24-hour basis to persons who are not rendered incapable of self-preservation by the services provided.

CLOSED SYSTEM. The use of a solid or liquid hazardous material involving a closed vessel or system that remains closed during normal operations where vapours emitted by the product are not liberated outside of the vessel or system and the product is not exposed to the atmosphere during normal operations; and all uses of compressed gases. Examples of closed systems for solids and liquids include product conveyed through a piping system into a closed vessel, system or piece of equipment.

COLLAR JOINT. Vertical longitudinal space between Wythes of masonry or between masonry Wythe and backup construction that is permitted to be filled with mortar or grout.

COLLECTOR. A horizontal diaphragm element parallel and in line with the applied force that collects and transfers diaphragm shear forces to the vertical elements of the lateral force-resisting system or distributes forces within the diaphragm, or both.

COMBINATION FIRE/SMOKE DAMPER. A listed device installed in ducts and air transfer openings designed to close automatically upon the detection of heat and resist the passage of flame and smoke. The device is installed to operate automatically, controlled by a smoke detection system, and where required, is capable of being positioned from a fire command center.

COMBINED PILE RAFT. A geotechnical composite construction that combines the bearing effect of both foundation elements, raft and piles, by taking into account interactions between the foundation elements and the subsoil.

COMBUSTIBLE DUST. Finely divided solid material that is 420 microns or less in diameter and which, when dispersed in air in the proper proportions, could be ignited by a flame, spark or other source of ignition.

COMBUSTIBLE FIBERS. Readily ignitable and free-burning materials in a fibrous or shredded form, such as cocoa fiber, cloth, cotton, excelsior, hay, hemp, henequen, isle, jute, kapok, oakum, rags, sisal, Spanish moss, straw, tow, wastepaper, certain synthetic fibers or other like materials. This definition does not include densely packed baled cotton.

COMMON PATH OF ESCAPE TRAVEL. That portion of exit access travel distance measured from the most remote point of each room, area or space to that point where the occupants have separate and distinct access to two exits or exit access doorways.

COMMON USE. Interior or exterior circulation paths, rooms, spaces or elements that are not for public use and are made available for the shared use of two or more people.

COMPRRESSED GAS. A material or mixture of materials that meets both of the following:

1. Is a gas at 20°C (68°F) or less at 14.7 pounds per square inch atmosphere (psia) (101 kPa) of pressure.

2. Has a boiling point of 20°C (68°F) or less at 14.7 psia (101 kPa) which is either liquefied, nonliquefied or in solution, except those gases which have no other health- or physical-hazard properties are not considered to be compressed until the pressure in the packaging exceeds 41 psia (282 kPa) at 20°C (68°F).
The states of a compressed gas are categorized as follows:

1. Nonliquefied compressed gases are gases, other than those in solution, which are in a packaging under the charged pressure and are entirely gaseous at a temperature of 20°C (68°F).

2. Liquefied compressed gases are gases that, in a packaging under the charged pressure, are partially liquid at a temperature of 68°F (20°C).

3. Compressed gases in solution are nonliquefied gases that are dissolved in a solvent.

4. Compressed gas mixtures consist of a mixture of two or more compressed gases contained in a packaging, the hazard properties of which are represented by the properties of the mixture as a whole.

CONCRETE.

Carbonate aggregate. Concrete made with aggregates consisting mainly of calcium or magnesium carbonate, such as limestone or dolomite, and containing 40 percent or less quartz, chert or flint.

Cellular. A lightweight insulating concrete made by mixing a preformed foam with Portland cement slurry and having a dry unit weight of approximately 30 pcf (480 \( \text{kg/m}^3 \)).

Lightweight aggregate. Concrete made with aggregates of expanded clay, shale, slag or slate or sintered fly ash or any natural lightweight aggregate meeting ASTM C330 and possessing equivalent fire-resistance properties and weighing 85 to 115 pcf (1360 to 1840 \( \text{kg/m}^3 \)).

Perlite. A lightweight insulating concrete having a dry unit weight of approximately 30 pcf (480 \( \text{kg/m}^3 \)) made with perlite concrete aggregate. Perlite aggregate is produced from a volcanic rock which, when heated, expands to form a glass-like material of cellular structure.

Sand-lightweight. Concrete made with a combination of expanded clay, shale, slag, slate, sintered fly ash, or any natural lightweight aggregate meeting ASTM C330 and possessing equivalent fire-resistance properties and natural sand. Its unit weight is generally between 105 and 120 pcf (1680 and 1920 \( \text{kg/m}^3 \)).

Siliceous aggregate. Concrete made with normal-weight aggregates consisting mainly of silica or compounds other than calcium or magnesium carbonate, which contains more than 40-percent quartz, chert or flint.

Vermiculite. A light weight insulating concrete made with vermiculite concrete aggregate which is laminated micaceous material produced by expanding the ore at high temperatures. When added to a Portland cement slurry the resulting concrete has a dry unit weight of approximately 30 pcf (480 \( \text{kg/m}^3 \)).

CONGREGATE LIVING FACILITIES. A building or part thereof that contains sleeping units where residents share bathroom or kitchen facilities, or both.

CONSTANTLY ATTENDED LOCATION. A designated location at a facility staffed by trained personnel on a continuous basis where alarm or supervisory signals are monitored and facilities are provided for notification of the fire department or other emergency services.

CONSTRUCTION DOCUMENTS. Written, graphic and pictorial documents prepared or assembled for describing the design, location and physical characteristics of the elements of a project necessary for obtaining a building permit.

CONTINUOUS INSULATION (ci). Insulating material that is continuous across all structural members without thermal bridges other than fasteners and service openings. It is installed on the interior or exterior, or is integral to any opaque surface of the building envelope.

CONTROL AREA. Spaces within a building where quantities of hazardous materials not exceeding the maximum allowable quantities per control area are stored, dispensed, used or handled. See the definition of “Outdoor control area” in the Ghana Fire Code.

CONTROLLED LOW-STRENGTH MATERIAL. A self-compacted, cementitious material used primarily as a backfill in place of compacted fill.

CONVENTIONAL LIGHT-FRAME CONSTRUCTION. Construction whose primary structural elements are formed by a system of repetitive wood-framing members.
CORNICE. A projecting horizontal molded element located at or near the top of an architectural feature.

CORRIDOR. An enclosed exit access component that defines and provides a path of escape travel.

CORRIDOR DAMPER. A listed device intended for use where air ducts penetrate or terminate at horizontal openings in the ceilings of fire-resistance-rated corridors, where the corridor ceiling is permitted to be constructed as required for the corridor walls.

CORROSION RESISTANCE. The ability of a material to withstand deterioration of its surface or its properties when exposed to its environment.

CORROSIVE. A chemical that causes visible destruction of, or irreversible alterations in, living tissue by chemical action at the point of contact.

COURT. An open, uncovered space, unobstructed to the sky, bounded on three or more sides by exterior building walls or other enclosing devices.

COVERED MALL BUILDING. A single building enclosing a number of tenants and occupants, such as retail stores, drinking and dining establishments, entertainment and amusement facilities, passenger transportation terminals, offices and other similar uses wherein two or more tenants have a main entrance into one or more malls. Anchor buildings shall not be considered as a part of the covered mall building. The term "covered mall building" shall include open mall buildings as defined below.

Mall. A roofed or covered common pedestrian area within a covered mall building that serves as access for two or more tenants and not to exceed three levels that are open to each other. The term "mall" shall include open malls as defined below.

Open mall. An unroofed common pedestrian way serving a number of tenants not exceeding three levels. Circulation at levels above grade shall be permitted to include open exterior balconies leading to exits discharging at grade.

Open mall building. Several structures housing a number of tenants, such as retail stores, drinking and dining establishments, entertainment and amusement facilities, offices, and other similar uses, wherein two or more tenants have a main entrance into one or more open malls. Anchor buildings are not considered as a part of the open mall building.

CRIPPLE WALL. A framed stud wall extending from the top of the foundation to the underside of floor framing for the lowest occupied floor level.

CRITICAL CIRCUIT. A circuit that requires continuous operation to ensure safety of the structure and occupants.

CROSS-LAMINATED TIMBER. A prefabricated engineered wood product consisting of not less than three layers of solid-sawn timber or structural composite timber where the adjacent layers are cross oriented and bonded with structural adhesive to form a solid wood element.

CRYOGENIC FLUID. A liquid having a boiling point lower than -150°F (-101°C) at 14.7 pounds per square inch atmosphere (psia) (an absolute pressure of 101 kPa).

CUSTODIAL CARE. Assistance with day-to-day living tasks; such as assistance with cooking, taking medication, bathing, using toilet facilities and other tasks of daily living. Custodial care includes persons receiving care who have the ability to respond to emergency situations and evacuate at a slower rate and/or who have mental and psychiatric complications.

DALLE GLASS. A decorative composite glazing material made of individual pieces of glass that are embedded in a cast matrix of concrete or epoxy.

DANGEROUS. Any building, structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, has partially collapsed, has moved off its foundation or lacks the necessary support of the ground.

2. There exists a significant risk of collapse, detachment or dislodgment of any portion, member, appurtenance or ornamentation of the building or structure under service loads.

DAY BOX. A portable magazine designed to hold explosive materials constructed in accordance with the requirements for a Type 3 magazine as defined and classified in Part 56 of the Ghana Fire Code.
DEAD LOAD. The weight of materials of construction incorporated into the building, including but not limited to walls, floors, roofs, ceilings, stairways, built-in partitions, finishes, cladding and other similarly incorporated architectural and structural items, and the weight of fixed service equipment, such as cranes, plumbing stacks and risers, electrical feeders, heating, ventilating and air-conditioning systems and automatic sprinkler systems.

DECORATIVE GLASS. A carved, leaded or Dalle glass or glazing material whose purpose is decorative or artistic, not functional; whose coloring, texture or other design qualities or components cannot be removed without destroying the glazing material and whose surface, or assembly into which it is incorporated, is divided into segments.

DECORATIVE MATERIALS. All materials applied over the building interior finish for decorative, acoustical or other effect including, but not limited to, curtains, draperies, fabrics and streamers; and all other materials utilized for decorative effect including, but not limited to, bulletin boards, artwork, posters, photographs, batting, cloth, cotton, hay, stalks, straw, vines, leaves, trees, moss and similar items, foam plastics and materials containing foam plastics. Decorative materials do not include wall coverings, ceiling coverings, floor coverings, ordinary window shades, interior finish and materials 0.64 mm (0.025 inch) or less in thickness applied directly to and adhering tightly to a substrate.

DEEP FOUNDATION. A deep foundation is a foundation element that does not satisfy the definition of a shallow foundation.

DEFEND-IN-PLACE. A method of emergency response that engages building components and trained staff to provide occupant safety during an emergency. Emergency response involves remaining in place, relocating within the building, or both, without evacuating the building.

DEFERRED SUBMISSION. Those portions of the design that are not submitted at the time of the application and that are to be submitted to the Head of Works within a specified period.

DEFLAGRATION. An exothermic reaction, such as the extremely rapid oxidation of a flammable dust or vapour in air, in which the reaction progresses through the unburned material at a rate less than the velocity of sound. A deflagration can have an explosive effect.

DELAYED-ACTION CLOSER. A self-closing device that incorporates a delay prior to the initiation of closing. Delayed-action closers are mechanical devices with an adjustable delay.

DELUGE SYSTEM. A sprinkler system employing open sprinklers attached to a piping system connected to a water supply through a valve that is opened by the operation of a detection system installed in the same areas as the sprinklers. When this valve opens, water flows into the piping system and discharges from all sprinklers attached thereto.

DESIGN EARTHQUAKE GROUND MOTION. The earthquake ground motion that buildings and structures are specifically proportioned to resist in this Code.

DESIGN FLOOD. The flood associated with the greater of the following two areas:

1. Area with a flood plain subject to a 1-percent or greater chance of flooding in any year.

2. Area designated as a flood hazard area on a community’s flood hazard map, or otherwise legally designated.

DESIGN FLOOD ELEVATION. The elevation of the “design flood,” including wave height, relative to the datum specified on the community's legally designated flood hazard map.

DESIGN STRENGTH. The product of the nominal strength and a resistance factor (or strength reduction factor).

DETACHED BUILDING. A separate single-storey building, without a basement or crawl space, used for the storage or use of hazardous materials and located an approved distance from all structures.

DETECTABLE WARNING. A standardized surface feature built in or applied to walking surfaces or other elements to warn visually impaired persons of hazards on a circulation path.

DETECTOR, HEAT. A fire detector that senses heat—either abnormally high temperature or rate of rise, or both.

DETONATION. An exothermic reaction characterized by the presence of a shock wave
in the material which establishes and maintains the reaction. The reaction zone progresses through the material at a rate greater than the velocity of sound. The principal heating mechanism is one of shock compression. Detonations have an explosive effect.

**DETOXIFICATION FACILITIES.** Facilities that provide treatment for substance abuse, serving care recipients who are incapable of self-preservation or who are harmful to themselves or others.

**DIAPHRAGM.** A horizontal or sloped system acting to transmit lateral forces to vertical elements of the lateral force-resisting system. When the term “diaphragm” is used, it shall include horizontal bracing systems.

Diaphragm, blocked. In light-frame construction, a diaphragm in which all sheathing edges not occurring on a framing member are supported on and fastened to blocking.

Diaphragm boundary. In light-frame construction, a location where shear is transferred into or out of the diaphragm sheathing. Transfer is either to a boundary element or to another force-resisting element.

Diaphragm chord. A diaphragm boundary element perpendicular to the applied load that is assumed to take axial stresses due to the diaphragm moment.

Diaphragm, unblocked. A diaphragm that has edge nailing at supporting members only. Blocking between supporting structural members at panel edges is not included. Diaphragm panels are field nailed to supporting members.

**DIRECT ACCESS.** A path of travel from a space to an immediately adjacent space through an opening in the common wall between the two spaces.

**DISPENSING.** The pouring or transferring of any material from a container, tank or similar vessel, whereby vapours, dusts, fumes, mists or gases are liberated to the atmosphere.

**DORMITORY.** A space in a building where group sleeping accommodations are provided in one room, or in a series of closely associated rooms, for persons not members of the same family group, under joint occupancy and single management, as in college dormitories or fraternity houses.

**DRAFTSTOP.** A material, device or construction installed to restrict the movement of air within open spaces of concealed areas of building components such as crawl spaces, floor/ceiling assemblies, roof/ceiling assemblies and attics.

**DRILLED SHAFT.** A cast-in-place deep foundation element, also referred to as a caisson, drilled pier or bored pile, constructed by drilling a hole (with or without permanent casing or drilling fluid) into soil or rock and filling it with fluid concrete after the drilling equipment is removed.

Socketed drilled shaft. A drilled shaft with a permanent pipe or tube casing that extends down to bedrock and an uncased socket drilled into the bedrock.

**DRY-CHEMICAL EXTINGUISHING AGENT.** A powder composed of small particles, usually of sodium bicarbonate, potassium bicarbonate, urea-potassium-based bicarbonate, potassium chloride or monoammonium phosphate, with added particulate material supplemented by special treatment to provide resistance to packing, resistance to moisture absorption (caking) and the proper flow capabilities.

**DRY FLOODPROOFING.** A combination of design modifications that results in a building or structure, including the attendant utilities and equipment and sanitary facilities, being water tight with walls substantially impermeable to the passage of water and with structural components having the capacity to resist loads.

**DWELLING.** A building that contains one or two dwelling units used, intended or designed to be used, rented, leased, let or hired out to be occupied for living purposes.

**DWELLING UNIT.** A single unit providing complete, independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking and sanitation.

**ESCAPE COURT.** A court or yard which provides access to a public way for one or more exits.

**ELECTRICAL CIRCUIT PROTECTIVE SYSTEM.** A specific construction of devices, materials, or coatings installed as a fire-resistive barrier system applied to electrical system components, such as cable trays,
conduits and other raceways, open run cables and conductors, cables, and conductors.

ELEVATOR GROUP. A grouping of elevators in a building located adjacent or directly across from one another that responds to common hall call buttons.

EMERGENCY ALARM SYSTEM. A system to provide indication and warning of emergency situations involving hazardous materials.

EMERGENCY CONTROL STATION. An approved location on the premises where signals from emergency equipment are received and which is staffed by trained personnel.

EMERGENCY ESCAPE AND RESCUE OPENING. An operable window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

EMERGENCY FACILITIES. Buildings and other structures that are intended to remain operational in the event of extreme environmental loading from flood, wind, or earthquakes.

EMERGENCY POWER SYSTEM. A source of automatic electric power of a required capacity and duration to operate required life safety, fire alarm, detection and ventilation systems in the event of a failure of the primary power. Emergency power systems are required for electrical loads where interruption of the primary power could result in loss of human life or serious injuries.

EMERGENCY VOICE/ALARM COMMUNICATIONS. Dedicated manual or automatic facilities for originating and distributing voice instructions, as well as alert and evacuation signals pertaining to a fire emergency, to the occupants of a building.

EMPLOYEE WORK AREA. All or any portion of a space used only by employees and only for work. Corridors, toilet rooms, kitchenettes and break rooms are not employee work areas.

ENGINEERED WOOD RIM BOARD. A full-depth structural composite timber, wood structural panel, structural glued laminated timber or prefabricated wood I-Joist member designed to transfer horizontal (shear) and vertical (compression) loads, provide attachment for diaphragm sheathing, siding and exterior deck ledgers, and provide lateral support at the ends of floor or roof joists or rafters.

EQUIPMENT PLATFORM. An unoccupied, elevated platform used exclusively for mechanical systems or industrial process equipment, including the associated elevated walkways, stairways, alternating tread devices and ladders necessary to access the platform.

EXHAUSTED ENCLOSURE. An appliance or piece of equipment that consists of a top, a back and two sides providing a means of local exhaust for capturing gases, fumes, vapours and mists. Such enclosures include laboratory hoods, exhaust fume hoods and similar appliances and equipment used to locally retain and exhaust the gases, fumes, vapours and mists that could be released. Rooms or areas provided with general ventilation, in themselves, are not exhausted enclosures.

EXISTING BUILDING. A building erected prior to the date of adoption of the appropriate Code, or one for which a legal building permit has been issued.

EXISTING STRUCTURE. A structure erected prior to the date of adoption of the appropriate Code, or one for which a legal building permit has been issued.

EXIT. That portion of a means of escape system between the exit access and the exit discharge or public way. Exit components include exterior exit doors at the level of exit discharge, interior exit stairways and ramps, exit passageways, exterior exit stairways and ramps and horizontal exits.

EXIT ACCESS. That portion of a means of escape system that leads from any occupied portion of a building or structure to an exit.

EXIT ACCESS DOORWAY. A door or access point along the path of escape travel from an occupied room, area or space where the path of escape enters an intervening room, corridor, exit access stairway or ramp.

EXIT ACCESS RAMP. A ramp within the exit access portion of the means of escape system.

EXIT ACCESS STAIRWAY. A stairway within the exit access portion of the means of escape system.

EXIT DISCHARGE. That portion of a means of escape system between the termination of an exit and a public way.
EXIT DISCHARGE, LEVEL OF. The storey at the point at which an exit terminates and an exit discharge begins.

EXIT PASSAGEWAY. An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protective, and provides for a protected path of escape travel in a horizontal direction to an exit or to the exit discharge.

EXPANDED VINYL WALL COVERING. Wall covering consisting of a woven textile backing, an expanded vinyl base coat layer and a nonexpanded vinyl skin coat. The expanded base coat layer is a homogeneous vinyl layer that contains a blowing agent. During processing, the blowing agent decomposes, causing this layer to expand by forming closed cells. The total thickness of the wall covering is approximately 1.4 mm to 1.78 mm (0.055 inch to 0.070 inch).

EXPLOSION. An effect produced by the sudden violent expansion of gases, which may be accompanied by a shock wave or disruption, or both, of enclosing materials or structures. An explosion could result from any of the following:

1. Chemical changes such as rapid oxidation, deflagration or detonation, decomposition of molecules and runaway polymerization (usually detonations).
2. Physical changes such as pressure tank ruptures.
3. Atomic changes (nuclear fission or fusion).

EXPLOSIVE. A chemical compound, mixture or device, the primary or common purpose of which is to function by explosion. The term includes, but is not limited to: dynamite, black powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord, and igniters.

EXTERIOR EXIT RAMP. An exit component that serves to meet one or more means of escape design requirements, such as required number of exits or exit access travel distance, and is open to yards, courts or public ways.

EXTERIOR INSULATION AND FINISH SYSTEMS (EIFS). EIFS are nonstructural, nonload-bearing, exterior wall cladding systems that consist of an insulation board attached either adhesively or mechanically, or both, to the substrate; an integrally reinforced base coat and a textured protective finish coat.

EXTERIOR INSULATION AND FINISH SYSTEMS (EIFS) WITH DRAINAGE. An EIFS that incorporates a means of drainage applied over a water-resistive barrier.

EXTERIOR SURFACES. Weather-exposed surfaces.

EXTERIOR WALL. A wall, bearing or nonbearing, that is used as an enclosing wall for a building, other than a fire wall, and that has a slope of 60 degrees (1.05 rad) or greater with the horizontal plane.

EXTERIOR WALL COVERING. A material or assembly of materials applied on the exterior side of exterior walls for the purpose of providing a weather-resisting barrier, insulation or for aesthetics, including but not limited to, veneers, siding, exterior insulation and finish systems, architectural trim and embellishments such as cornices, soffits, facias, gutters and leaders.

EXTERIOR WALL ENVELOPE. A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

FABRIC PARTITION. A partition consisting of a finished surface made of fabric, without a continuous rigid backing, that is directly attached to a framing system in which the vertical framing members are spaced greater than 1219 mm (4 feet) on center.

FABRICATED ITEM. Structural, load-bearing or lateral load-resisting members or assemblies consisting of materials assembled prior to installation in a building or structure, or subjected to operations such as heat treatment, thermal cutting, cold working or reforming after manufacture and prior to installation in a building or structure. Materials produced in accordance with standards referenced by this Code, such as rolled structural steel shapes,
steel reinforcing bars, masonry units and wood structural panels, or in accordance with a referenced standard that provides requirements for quality control done under the supervision of a third-party quality control agency, are not “fabricated items.”

FABRICATION AREA. An area within a semiconductor fabrication facility and related research and development areas in which there are processes using hazardous production materials. Such areas are allowed to include ancillary rooms or areas such as dressing rooms and offices that are directly related to the fabrication area processes.

FACILITY. All or any portion of buildings, structures, site improvements, elements and pedestrian or vehicular routes located on a site.

FACTORED LOAD. The product of a nominal load and a load factor.

FENESTRATION. Products classified as either vertical fenestration or skylights and sloped glazing, installed in such a manner as to preserve the weather-resistant barrier of the wall or roof in which they are installed. Fenestration includes products with glass or other transparent or translucent materials.

FENESTRATION, VERTICAL. Windows that are fixed or movable, opaque doors, glazed doors, glazed block and combination opaque and glazed doors installed in a wall at less than 15 degrees from the vertical.

FIBER-CEMENT (BACKER BOARD, SIDING, SOFFIT, TRIM AND UNDERLAYMENT) PRODUCTS. Manufactured thin clause composites of hydraulic cementitious matrices and discrete nonasbestos fibers.

FIBER-REINFORCED POLYMER. A polymeric composite material consisting of reinforcement fibers, such as glass, impregnated with a fiber-binding polymer which is then molded and hardened. Fiber-reinforced polymers are permitted to contain cores laminated between fiber-reinforced polymer facings.

FIBERBOARD. A fibrous, homogeneous panel made from lignocellulosic fibers (usually wood or cane) and having a density of less than 31 pounds per cubic foot (pcf) (497 kg/m$^3$) but more than 10 pcf (160 kg/m$^3$).

FIRE ALARM CONTROL UNIT. A system component that receives inputs from automatic and manual fire alarm devices and may be capable of supplying power to detection devices and transponders or off-premises transmitters. The control unit may be capable of providing a transfer of power to the notification appliances and transfer of condition to relays or devices.

FIRE ALARM SIGNAL. A signal initiated by a fire alarm-initiating device such as a manual fire alarm box, automatic fire detector, workflow switch or other device whose activation is indicative of the presence of a fire or fire signature.

FIRE ALARM SYSTEM. A system or portion of a combination system consisting of components and circuits arranged to monitor and annunciate the status of fire alarm or supervisory signal-initiating devices and to initiate the appropriate response to those signals.

FIRE AREA. The aggregate floor area enclosed and bounded by fire walls, fire barriers, exterior walls or horizontal assemblies of a building. Areas of the building not provided with surrounding walls shall be included in the fire area if such areas are included within the horizontal projection of the roof or floor next above.

FIRE BARRIER. A fire-resistance-rated wall assembly of materials designed to restrict the spread of fire in which continuity is maintained.

FIRE COMMAND CENTER. The principal attended or unattended location where the status of detection, alarm communications and control systems is displayed, and from which the systems can be manually controlled.

FIRE DAMPER. A listed device installed in ducts and air transfer openings designed to close automatically upon detection of heat and resist the passage of flame. Fire dampers are classified for use in either static systems that will automatically shut down in the event of a fire, or in dynamic systems that continue to operate during a fire. A dynamic fire damper is tested and rated for closure under elevated temperature airflow.

FIRE DETECTOR, AUTOMATIC. A device designed to detect the presence of a fire signature and to initiate action.

FIRE DOOR. The door component of a fire door assembly.

FIRE DOOR ASSEMBLY. Any combination of a fire door, frame, hardware and other
accessories that together provide a specific degree of fire protection to the opening.

FIRE EXIT HARDWARE. Panic hardware that is listed for use on fire door assemblies.

FIRE LANE. A road or other passageway developed to allow the passage of fire apparatus. A fire lane is not necessarily intended for vehicular traffic other than fire apparatus.

FIRE PARTITION. A vertical assembly of materials designed to restrict the spread of fire in which openings are protected.

FIRE PROTECTION RATING. The period of time that an opening protective will maintain the ability to confine a fire as determined by tests specified in this Code. Ratings are stated in hours or minutes.

FIRE PROTECTION SYSTEM. Approved devices, equipment and systems or combinations of systems used to detect a fire, activate an alarm, extinguish or control a fire, control or manage smoke and products of a fire or any combination thereof.

FIRE RATING. The time period that the through-penetration firestop system limits the spread of fire through the penetration when tested in accordance with ASTM E814.

FIRE-RATED GLAZING. Glazing with either a fire protection rating or a fire-resistance rating.

FIRE RESISTANCE. That property of materials or their assemblies that prevents or retards the passage of excessive heat, hot gases or flames under conditions of use.

FIRE-RESISTANCE RATING. The period of time a building element, component or assembly maintains the ability to confine a fire, continues to perform a given structural function, or both, as determined by the tests, or the methods based on tests, prescribed in this Code.

FIRE-RESISTANT JOINT SYSTEM. An assemblage of specific materials or products that are designed, tested and fire-resistance rated in accordance with either ASTM E1966 to resist for a prescribed period of time the passage of fire through joints made in or between fire-resistance-rated assemblies.

FIRE SAFETY FUNCTIONS. Building and fire control functions that are intended to increase the level of life safety for occupants or to control the spread of harmful effects of fire.

FIRE SEPARATION DISTANCE. The distance measured from the building face to one of the following:

1. The closest interior plot line.
2. To the centerline of a street, an alley or public way.
3. To an imaginary line between two buildings on the plot.

The distance shall be measured at right angles from the face of the wall.

FIRE WALL. A fire-resistance-rated wall having protected openings, which restricts the spread of fire and extends continuously from the foundation to or through the roof, with sufficient structural stability under fire conditions to allow collapse of construction on either side without collapse of the wall.

FIRE WINDOW ASSEMBLY. A window constructed and glazed to give protection against the passage of fire.

FIREBLOCKING. Building materials, or materials approved for use as fireblocking, installed to resist the free passage of flame to other areas of the building through concealed spaces.

FIREPLACE. A hearth and fire chamber or similar prepared place in which a fire may be made and which is built in conjunction with a chimney.

FIREPLACE THROAT. The opening between the top of the firebox and the smoke chamber.

FIXED BASE OPERATOR (FBO). A commercial business granted the right by the airport sponsor to operate on an airport and provide aeronautical services, such as fueling, hangaring, tie-down and parking, aircraft rental, aircraft maintenance and flight instruction.

FIXED SEATING. Furniture or fixture designed and installed for the use of sitting and secured in place including bench-type seats and seats with or without backs or armrests.

FLAME SPREAD. The propagation of flame over a surface.

FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless
number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84.

**FLAMMABLE GAS.** A material that is a gas at 68°F (20°C) or less at 14.7 pounds per square inch atmosphere (psia) (101 kPa) of pressure [a material that has a boiling point of 68°F (20°C) or less at 14.7 psia (101 kPa)], which also meets one of the following:

1. Is ignitable at 14.7 psia (101 kPa) when in a mixture of 13 percent or less by volume with air.

2. Has a flammable range at 14.7 psia (101 kPa) with air of at least 12 percent, regardless of the lower limit.

The limits specified shall be determined at 14.7 psi (101 kPa) of pressure and a temperature of 68°F (20°C) in accordance with ASTM E681.

**FLAMMABLE LIQUEFIED GAS.** A liquefied compressed gas which, under a charged pressure, is partially liquid at a temperature of 68°F (20°C) and which is flammable.

**FLAMMABLE MATERIAL.** A material capable of being readily ignited from common sources of heat or at a temperature of 600°F (316°C) or less.

**FLAMMABLE SOLID.** A solid, other than a blasting agent or explosive, that is capable of causing fire through friction, absorption or moisture, spontaneous chemical change, or retained heat from manufacturing or processing, or which has an ignition temperature below 100°C (212°F) or which burns so vigorously and persistently when ignited as to create a serious hazard.

**FLAMMABLE VAPOURS OR FUMES.** The concentration of flammable constituents in air that exceeds 25 percent of their lower flammable limit (LFL).

**FLASH POINT.** The minimum temperature in degrees Celsius at which a liquid will give off sufficient vapours to form an ignitable mixture with air near the surface or in the container, but will not sustain combustion.

**FLIGHT.** A continuous run of treads, winders or combination thereof from one landing to another.

**FLOOD or FLOODING.** A general and temporary condition of partial or complete inundation of normally dry land from:

1. The overflow of inland or tidal waters.

2. The unusual and rapid accumulation or runoff of surface waters from any source.

**FLOOD DAMAGE-RESISTANT MATERIALS.** Any construction material capable of withstanding direct and prolonged contact with floodwaters without sustaining any damage that requires more than cosmetic repair.

**FLOOD HAZARD AREA.** The greater of the following two areas:

1. The area within a flood plain subject to a 1-percent or greater chance of flooding in any year.

2. The area designated as a flood hazard area on a community’s flood hazard map, or otherwise legally designated.

**FLOODWAY.** The channel of the river, creek or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height.

**FLOOR AREA, GROSS.** The floor area within the inside perimeter of the exterior walls of the building under consideration, exclusive of vent shafts and courts, without deduction for corridors, stairways, ramps, closets, the thickness of interior walls, columns or other features. The floor area of a building, or portion thereof, not provided with surrounding exterior walls shall be the usable area under the horizontal projection of the roof or floor above. The gross floor area shall not include shafts with no openings or interior courts.

**FLOOR AREA, NET.** The actual occupied area not including unoccupied accessory areas such as corridors, stairways, ramps, toilet rooms, mechanical rooms and closets.

**FLOOR FIRE DOOR ASSEMBLY.** A combination of a fire door, a frame, hardware and other accessories installed in a horizontal plane, which together provide a specific degree of fire protection to a through-opening in a fire-resistance-rated floor.

**FOAM-EXTINGUISHING SYSTEM.** A special system discharging a foam made from
concentrates, either mechanically or chemically, over the area to be protected.

**FOAM PLASTIC INSULATION.** A plastic that is intentionally expanded by the use of a foaming agent to produce a reduced-density plastic containing voids consisting of open or closed cells distributed throughout the plastic for thermal insulating or acoustical purposes and that has a density less than 20 pounds per cubic foot (pcf) (320 kg/m³).

**FOLDING AND TELESCOPIC SEATING.** Tiered seating having an overall shape and size that is capable of being reduced for purposes of moving or storing and is not a building element.

**FOOD COURT.** A public seating area located in the mall that serves adjacent food preparation tenant spaces.

**FOSTER CARE FACILITIES.** Facilities that provide care to more than five children, 1/2 years of age or less.

**FOUNDATION PIER (for Part 21).** An isolated vertical foundation member whose horizontal dimension measured at right angles to its thickness does not exceed three times its thickness and whose height is equal to or less than four times its thickness.

**FRAME STRUCTURE.** A building or other structure in which vertical loads from floors and roofs are primarily supported by columns.

**FUEL CELL POWER SYSTEM, STATIONARY.** A stationary energy-generation system that converts the chemical energy of a fuel and oxidant to electric energy (DC or AC electricity) by an electrochemical process.

**Field-fabricated fuel cell power system.** A stationary fuel cell power system that is assembled at the job site and is not a preengineered or prepackaged factory-assembled fuel cell power system.

**Preengineered fuel cell power system.** A stationary fuel cell power system consisting of components and modules that are produced in a factory and shipped to the job site for assembly.

**Prepackaged fuel cell power system.** A stationary fuel cell power system that is factory assembled as a single, complete unit and shipped as a complete unit for installation at the job site.

**GABLE.** The triangular portion of a wall beneath the end of a dual-slope, pitched, or mono-slope roof or portion thereof and above the top plates of the storey or level of the ceiling below.

**GAMING.** To deal, operate, carry on, conduct, maintain or expose for play any game played with cards, dice, equipment or any mechanical, electromechanical or electronic device or machine for money, property, checks, credit or any representative of value except where occurring at private home or operated by a charitable or educational organization.

**GAMING AREA.** Single or multiple areas of a building or facility where gaming machines or tables are present and gaming occurs, including but not limited to, primary casino gaming areas, VIP gaming areas, high-roller gaming areas, bar tops, lobbies, dedicated rooms or spaces such as in retail or restaurant establishments, sports books and tournament areas.

**GAMING MACHINE TYPE.** Categorization of gaming machines per type of game played on them, including but not limited to, slot machines, video poker and video keno.

**GAMING TABLE TYPE.** Categorization of gaming tables per the type of game played on them, including, but not limited to, baccarat, bingo, blackjack/21, craps, pai gow, poker, roulette.

**GAS CABINET.** A fully enclosed, ventilated noncombustible enclosure used to provide an isolated environment for compressed gas cylinders in storage or use. Doors and access ports for exchanging cylinders and accessing pressure-regulating controls are allowed to be included.

**GAS DETECTION SYSTEM.** A system or portion of a combination system that utilizes one or more stationary sensors to detect the presence of a specified gas at a specified concentration and initiate one or more responses required by this Code, such as notifying a responsible person, activating an alarm signal, or activating or deactivating equipment. A self-contained gas detection and alarm device is not classified as a gas detection system.

**GAS ROOM.** A separately ventilated, fully enclosed room in which only compressed...
gases and associated equipment and supplies are stored or used.

**GASEOUS HYDROGEN SYSTEM.** An assembly of piping, devices and apparatus designed to generate, store, contain, distribute or transport a nontoxic, gaseous hydrogen-containing mixture having not less than 95-percent hydrogen gas by volume and not more than 1-percent oxygen by volume. Gaseous hydrogen systems consist of items such as compressed gas containers, reactors and appurtenances, including pressure regulators, pressure relief devices, manifolds, pumps, compressors and interconnecting piping and tubing and controls.

**GLASS FIBERBOARD.** Fibrous glass roof insulation consisting of inorganic glass fibers formed into rigid boards using a binder. The board has a top surface faced with asphalt and kraft reinforced with glass fiber.

**GRADE (TIMBER).** The classification of timber in regard to strength and utility with Ghana Standards Grading Rules.

**GRADE FLOOR OPENING.** A window or other opening located such that the sill height of the opening is not more than 44 inches (1118 mm) above or below the finished ground level adjacent to the opening.

**GRADE PLANE.** A reference plane representing the average of finished ground level adjoining the building at exterior walls. Where the finished ground level slopes away from the exterior walls, the reference plane shall be established by the lowest points within the area between the building and the plot line or, where the plot line is more than 1829 mm (6 feet) from the building, between the building and a point 1829 mm (6 feet) from the building.

**GRANDSTAND.** Tiered seating supported on a dedicated structural system and two or more rows high and is not a building element.

**GREENHOUSE.** A structure or thermally isolated area of a building that maintains a specialized sunlit environment used for and essential to the cultivation, protection or maintenance of plants.

**GROSS LEASABLE AREA.** The total floor area designed for tenant occupancy and exclusive use. The area of tenant occupancy is measured from the centerlines of joint partitions to the outside of the tenant walls. All tenant areas, including areas used for storage, shall be included in calculating gross leasable area.

**GROUP HOME.** A facility for social rehabilitation, substance abuse or mental health problems that contains a group housing arrangement that provides custodial care but does not provide medical care.

**GUARD.** A building component or a system of building components located at or near the open sides of elevated walking surfaces that minimizes the possibility of a fall from the walking surface to a lower level.

**GUESTROOM.** A room used or intended to be used by one or more guests for living or sleeping purposes.

**GYPSUM BOARD.** The generic name for a family of sheet products consisting of a noncombustible core primarily of gypsum with paper surfacing. Gypsum wallboard, gypsum sheathing, gypsum base for gypsum veneer plaster, exterior gypsum soffit board, predecorated gypsum board and water-resistant gypsum backing board.

**GYPSUM PANEL PRODUCT.** The general name for a family of sheet products consisting essentially of gypsum.

**GYPSUM PLASTER.** A mixture of calcined gypsum or calcined gypsum and lime and aggregate and other approved materials as specified in this Code.

**GYPSUM VENEER PLASTER.** Gypsum plaster applied to an approved base in one or more coats normally not exceeding 6.4 mm (\(\frac{1}{4}\) inch) in total thickness.

**HABITABLE SPACE.** A space in a building for living, sleeping, eating or cooking. Bathrooms, toilet rooms, closets, halls, storage or utility spaces and similar areas are not considered habitable spaces.

**HALOGENATED EXTINGUISHING SYSTEM.** A fire-extinguishing system using one or more atoms of an element from the halogen chemical series: fluorine, chlorine, bromine and iodine.

**HANDLING.** The deliberate transport by any means to a point of storage or use.

**HANDRAIL.** A horizontal or sloping rail intended for grasping by the hand for guidance or support.

**HARDBOARD.** A fibrous-felted, homogeneous panel made from lignocellulosic fibers
consolidated under heat and pressure in a hot press to a density not less than 31 pcf (497 kg/m3).

HAZARDOUS MATERIALS. Those chemicals or substances that are physical hazards or health hazards as classified in this Code and the Ghana Fire Code, whether the materials are in usable or waste condition.

HAZARDOUS PRODUCTION MATERIAL (HPM). A solid, liquid or gas associated with semiconductor manufacturing that has a degree-of-hazard rating in health, flammability or instability of Class 3 or 4 as ranked by the Ghana Fire Code and which is used directly in research, laboratory or production processes which have as their end product materials that are not hazardous.

HEAD JOINT. Vertical mortar joint placed between masonry units within the Wythe at the time the masonry units are laid.

HEALTH HAZARD. A classification of a chemical for which there is statistically significant evidence that acute or chronic health effects are capable of occurring in exposed persons. The term "health hazard" includes chemicals that are toxic or highly toxic, and corrosive.

HEIGHT, BUILDING. The vertical distance from grade plane to the average height of the highest roof surface.

HELICAL PILE. Manufactured steel deep foundation element consisting of a central shaft and one or more helical bearing plates. A helical pile is installed by rotating it into the ground. Each helical bearing plate is formed into a screw thread with a uniform defined pitch.

HELIPAD. A structural surface that is used for the landing, taking off, taxiing and parking of helicopters.

HELIPORT. An area of land or water or a structural surface that is used, or intended for use, for the landing and taking off of helicopters, and any appurtenant areas that are used, or intended for use, for heliport buildings or other heliport facilities.

HELISTOP. The same as "heliport," except that no fueling, defueling, maintenance, repairs or storage of helicopters is permitted.

HIGHER EDUCATION LABORATORY. Laboratories in Group B occupancies used for educational purposes above the 12th grade. Storage, use and handling of chemicals in such laboratories shall be limited to purposes related to testing, analysis, teaching, research or developmental activities on a nonproduction basis.

HIGHLY TOXIC. A material which produces a lethal dose or lethal concentration that falls within any of the following categories:

1. A chemical that has a median lethal dose (LD₅₀) of 50 milligrams or less per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.

2. A chemical that has a median lethal dose (LD₅₀) of 200 milligrams or less per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.

3. A chemical that has a median lethal concentration (LC₅₀) in air of 200 parts per million by volume or less of gas or vapour, or 2 milligrams per liter or less of mist, fume or dust, when administered by continuous inhalation for 1 hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

Mixtures of these materials with ordinary materials, such as water, might not warrant classification as highly toxic. While this system is basically simple in application, any hazard evaluation that is required for the precise categorization of this type of material shall be performed by experienced, technically competent persons.

HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATE (HPL). Panels consisting of layers of cellulose fibrous material impregnated with thermosetting resins and bonded together by a high-pressure process to form a homogeneous nonporous core suitable for exterior use.

HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATE (HPL) SYSTEM. An exterior wall covering fabricated using HPL in a specific assembly including joints, seams, attachments, substrate,
framing and other details as appropriate to a particular design.

**HIGH-RISE BUILDING.** A building with an occupied floor located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.

**HISTORIC BUILDINGS.** Any building or structure that is one or more of the following:

1. Listed or certified as eligible for listing by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, in the National Register of Historic Places.

2. Designated as historic under an applicable state or local law.

3. Certified as a contributing resource within a National Register, state designated or locally designated historic district.

**HORIZONTAL ASSEMBLY.** A fire-resistance-rated floor or roof assembly of materials designed to restrict the spread of fire in which continuity is maintained.

**HORIZONTAL EXIT.** An exit component consisting of fire-resistance-rated construction and opening protective intended to compartmentalize portions of a building thereby creating refuge areas that afford safety from the fire and smoke from the area of fire origin.

**HOSPITALS AND PSYCHIATRIC HOSPITALS.** Facilities that provide care or treatment for the medical, psychiatric, obstetrical, or surgical treatment of care recipients who are incapable of self-preservation.

**HOUSING UNIT.** A dormitory or a group of cells with a common dayroom in Group I-3.

**HPM ROOM.** A room used in conjunction with or serving a Group H-5 occupancy, where HPM is stored or used and which is classified as a Group H-2, H-3 or H-4 occupancy.

**HYDROGEN FUEL GAS ROOM.** A room or space that is intended exclusively to house a gaseous hydrogen system.

**IMMEDIATELY DANGEROUS TO LIFE AND HEALTH (IDLH).** The concentration of airborne contaminants which poses a threat of death, immediate or delayed permanent adverse health effects, or effects that could prevent escape from such an environment. This contaminant concentration level is established by the National Institute of Occupational Safety and Health (NIOSH) based on both toxicity and flammability.

**IMPACT LOAD.** The load resulting from moving machinery, elevators, cranes, vehicles and other similar forces and kinetic loads, pressure and possible surcharge from fixed or moving loads.

**INCOMPATIBLE MATERIALS.** Materials that, when mixed, have the potential to react in a manner that generates heat, fumes, gases or byproducts which are hazardous to life or property.

**INERT GAS.** A gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the Code, inert gases do not exhibit either physical or health hazard properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a compressed gas. Some of the more common inert gases include argon, helium, krypton, neon, nitrogen and xenon.

**INITIATING DEVICE.** A system component that originates transmission of a change-of-state condition, such as in a smoke detector, manual fire alarm box or supervisory switch.

**INTERIOR EXIT RAMP.** An exit component that serves to meet one or more means of escape design requirements, such as required number of exits or exit access travel distance, and provides for a protected path of escape travel to the exit discharge or public way.

**INTERIOR EXIT STAIRWAY.** An exit component that serves to meet one or more means of escape design requirements, such as required number of exits or exit access travel distance, and provides for a protected path of escape travel to the exit discharge or public way.

**INTERIOR FINISH.** Interior finish includes interior wall and ceiling finish and interior floor finish.

**INTERIOR FLOOR FINISH.** The exposed floor surfaces of buildings including coverings applied over a finished floor or stair, including risers.

**INTERIOR FLOOR-WALL BASE.** Interior floor finish trim used to provide a functional or
decorative border at the interclause of walls and floors.

INTERIOR SURFACES. Surfaces other than weather exposed surfaces.

INTERIOR WALL AND CEILING FINISH. The exposed interior surfaces of buildings, including but not limited to: fixed or movable walls and partitions; toilet room privacy partitions; columns; ceilings; and interior wainscoting, paneling or other finish applied structurally or for decoration, acoustical correction, surface insulation, structural fire resistance or similar purposes, but not including trim.

INTERLAYMENT. A layer of felt or nonbituminous saturated felt not less than 18 inches (457 mm) wide, shingled between each course of a wood-shake roof covering.

INTUMESCENT FIRE-RESISTANT COATINGS. Thin film liquid mixture applied to substrates by brush, roller, spray or trowel which expands into a protective foamed layer to provide fire-resistant protection of the substrates when exposed to flame or intense heat.

JOINT. The opening in or between adjacent assemblies that is created due to building tolerances, or is designed to allow independent movement of the building in any plane caused by thermal, seismic, wind or any other loading.

JURISDICTION. The governmental agency that has adopted this Code.

LABEL. An identification applied on a product by the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material and the name and identification of an approved agency, and that indicates that the representative sample of the product or material has been tested and evaluated by an approved agency.

LABORATORY SUITE. A fire-rated, enclosed laboratory area providing one or more laboratory spaces within a Group B educational occupancy that includes ancillary uses such as offices, bathrooms and corridors that are contiguous with the laboratory area.

LIGHT-DIFFUSING SYSTEM. Construction consisting in whole or in part of lenses, panels, grids and baffles made with light-transmitting plastics positioned below independently mounted electrical light sources, skylights or light-transmitting plastic roof panels. Lenses, panels, grids and baffles that are part of an electrical fixture shall not be considered as a light-diffusing system.

LIGHT-FRAME CONSTRUCTION. A type of construction whose vertical and horizontal structural elements are primarily formed by a system of repetitive wood or cold-formed steel framing members.

LIGHT-TRANSMITTING PLASTIC ROOF PANELS. Structural plastic panels other than skylights that are fastened to structural members, or panels or sheathing and that are used as light-transmitting media in the plane of the roof.

LIGHT-TRANSMITTING PLASTIC WALL PANELS. Plastic materials that are fastened to structural members, or to structural panels or sheathing, and that are used as light-transmitting media in exterior walls.

LIMIT STATE. A condition beyond which a structure or member becomes unfit for service and is judged to be no longer useful for its intended function (serviceability limit state) or to be unsafe (strength limit state).

LIQUID. A material that has a melting point that is equal to or less than 20°C (68°F) and a boiling point that is greater than 20°C (68°F) at 14.7 pounds per square inch absolute (psia) (101 kPa). When not otherwise identified, the term “liquid” includes both flammable and combustible liquids.

LIQUID STORAGE ROOM. A room classified as a Group H-3 occupancy used for the storage of flammable or combustible liquids in a closed condition.

LIQUID USE, DISPENSING AND MIXING ROOM. A room in which Class I, II and IIIA flammable or combustible liquids are used, dispensed or mixed in open containers.

LISTED. Equipment, materials, products or services included in a list published by an organization acceptable to the Head of Works and concerned with evaluation of products or services that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services and whose listing states either that the equipment, material, product or service meets identified standards or has been tested and found suitable for a specified purpose.

LIVE/WORK UNIT. A dwelling unit or sleeping unit in which a significant portion of the space
includes a nonresidential use that is operated by the tenant.

LIVE LOAD. A load produced by the use and occupancy of the building or other structure that does not include construction or environmental loads such as wind load, snow load, rain load, earthquake load, flood load or dead load.

LIVE LOAD, ROOF. A load on a roof produced:

1. During maintenance by workers, equipment and materials;
2. During the life of the structure by movable objects such as planters or other similar small decorative appurtenances that are not occupancy related; or
3. By the use and occupancy of the roof such as for roof gardens or assembly areas.

LOAD AND RESISTANCE FACTOR DESIGN (LRFD). A method of proportioning structural members and their connections using load and resistance factors such that no applicable limit state is reached when the structure is subjected to appropriate load combinations. The term “LRFD” is used in the design of steel and wood structures.

LOAD EFFECTS. Forces and deformations produced in structural members by the applied loads.

LOAD FACTOR. A factor that accounts for deviations of the actual load from the nominal load, for uncertainties in the analysis that transforms the load into a load effect, and for the probability that more than one extreme load will occur simultaneously.

LOADS. Forces or other actions that result from the weight of building materials, occupants and their possessions, environmental effects, differential movement and restrained dimensional changes. Permanent loads are those loads in which variations over time are rare or of small magnitude, such as dead loads. All other loads are variable loads (see “Nominal loads”).

LODGING HOUSE. A one-family dwelling where one or more occupants are primarily permanent in nature and rent is paid for guest rooms.

LOW-ENERGY POWER-OPERATED DOOR. A swinging, sliding or folding door that opens automatically upon an action by a pedestrian such as pressing a push plate or waving a hand in front of a sensor. The door closes automatically, and operates with decreased forces and decreased speeds (see “Power-assisted door” and “Power-operated door”).

LOWER FLAMMABLE LIMIT (LFL). The minimum concentration of vapour in air at which propagation of flame will occur in the presence of an ignition source. The LFL is sometimes referred to as “LEL” or “lower explosive limit.”

LOWEST FLOOR. The lowest floor of the lowest enclosed area, including basement, but excluding any unfinished or flood-resistant enclosure, usable solely for vehicle parking, building access or limited storage provided that such enclosure is not built so as to render the structure in violation of Clause 1612.

MAIN WINDFORCE-RESISTING SYSTEM. An assemblage of structural elements assigned to provide support and stability for the overall structure. The system generally receives wind loading from more than one surface.

MANUAL FIRE ALARM BOX. A manually operated device used to initiate an alarm signal.

MANUFACTURER’S DESIGNATION. An identification applied on a product by the manufacturer indicating that a product or material complies with a specified standard or set of rules (see “Label” and “Mark”).

MARK. An identification applied on a product by the manufacturer indicating the name of the manufacturer and the function of a product or material (see “Label” and “Manufacturer’s designation”).

MARQUEE. A canopy that has a top surface which is sloped less than 25 degrees from the horizontal and is located less than 3048 mm (10 feet) from operable openings above or adjacent to the level of the marquee.

MASONRY. A built-up construction or combination of building units or materials of clay, shale, concrete, glass, gypsum, stone or other approved units bonded together with or without mortar or grout or other accepted methods of joining.

Glass unit masonry. Masonry composed of glass units bonded by mortar.
Plain masonry. Masonry in which the tensile resistance of the masonry is taken into consideration and the effects of stresses in reinforcement are neglected.

Reinforced masonry. Masonry construction in which reinforcement acting in conjunction with the masonry is used to resist forces.

Solid masonry. Masonry consisting of solid masonry units laid contiguously with the joints between the units filled with mortar.

Unreinforced (plain) masonry. Masonry in which the tensile resistance of masonry is taken into consideration and the resistance of the reinforcing steel, if present, is neglected.

MASONRY UNIT. Brick, tile, stone, glass block or concrete block conforming to the requirements specified in Clause 22.3.

Hollow. A masonry unit whose net cross-clause area in any plane parallel to the load-bearing surface is less than 75 percent of its gross cross-clause area measured in the same plane.

Solid. A masonry unit whose net cross-clause area in every plane parallel to the load-bearing surface is 75 percent or more of its gross cross-clause area measured in the same plane.

MASTIC FIRE-RESISTANT COATINGS. Liquid mixture applied to a substrate by brush, roller, spray or trovell that provides fire-resistant protection of a substrate when exposed to flame or intense heat.

MEANS OF ESCAPE. A continuous and unobstructed path of vertical and horizontal escape travel from any occupied portion of a building or structure to a public way. A means of escape consists of three separate and distinct parts: the exit access, the exit and the exit discharge.

MECHANICAL-ACCESS OPEN PARKING GARAGES. Open parking garages employing parking machines, lifts, elevators or other mechanical devices for vehicles moving from and to street level and in which public occupancy is prohibited above the street level.

MECHANICAL EQUIPMENT SCREEN. A rooftop structure, not covered by a roof, used to aesthetically conceal plumbing, electrical or mechanical equipment from view.

MEDICAL CARE. Care involving medical or surgical procedures, nursing or for psychiatric purposes.

MEMBRANE-COVERED CABLE STRUCTURE. A nonpressurized structure in which a mast and cable system provides support and tension to the membrane weather barrier and the membrane imparts stability to the structure.

MEMBRANE-COVERED FRAME STRUCTURE. A nonpressurized building wherein the structure is composed of a rigid framework to support a tensioned membrane which provides the weather barrier.

MEMBRANE PENETRATION. A breach in one side of a floor-ceiling, roof-ceiling or wall assembly to accommodate an item installed into or passing through the breach.

MEMBRANE-PENETRATION FIRESTOP. A material, device or construction installed to resist for a prescribed time period the passage of flame and heat through openings in a protective membrane in order to accommodate cables, cable trays, conduit, tubing, pipes or similar items.

MEMBRANE-PENETRATION FIRESTOP SYSTEM. An assemblage consisting of a fire-resistance-rated floor-ceiling, roof-ceiling or wall assembly, one or more penetrating items installed into or passing through the breach in one side of the assembly and the materials or devices, or both, installed to resist the spread of fire into the assembly for a prescribed period of time.

MERCHANDISE PAD. A merchandise pad is an area for display of merchandise surrounded by aisles, permanent fixtures or walls. Merchandise pads contain elements such as nonfixed and moveable fixtures, cases, racks, counters and partitions as indicated in Clause 1.6.2 from which customers browse or shop.

METAL COMPOSITE MATERIAL (MCM). A factory-manufactured panel consisting of metal skins bonded to both faces of a solid plastic core.

METAL COMPOSITE MATERIAL (MCM) SYSTEM. An exterior wall covering fabricated using MCM in a specific assembly including joints, seams, attachments, substrate, framing
and other details as appropriate to a particular design.

**METAL ROOF PANEL.** An interlocking metal sheet having a minimum installed weather exposure of 3 square feet (0.279 m²) per sheet.

**METAL ROOF SHINGLE.** An interlocking metal sheet having an installed weather exposure less than 3 square feet (0.279 m²) per sheet.

**MEZZANINE.** An intermediate level or levels between the floor and ceiling of any storey and in accordance with Clause 505.

**MICROPILE.** A micropile is a bored, grouted-in-place deep foundation element that develops its load-carrying capacity by means of a bond zone in soil, bedrock or a combination of soil and bedrock.

**MINERAL BOARD.** A rigid felted thermal insulation board consisting of either felted mineral fiber or cellular beads of expanded aggregate formed into flat rectangular units.

**MINERAL FIBER.** Insulation composed principally of fibers manufactured from rock, slag or glass, with or without binders.

**MINERAL WOOL.** Synthetic vitreous fiber insulation made by melting predominately igneous rock or furnace slag, and other inorganic materials, and then physically forming the melt into fibers.

**MODIFIED BITUMEN ROOF COVERING.** One or more layers of polymer-modified asphalt sheets. The sheet materials shall be fully adhered or mechanically attached to the substrate or held in place with an approved ballast layer.

**MORTAR.** A mixture consisting of cementitious materials, fine aggregates, water, with or without admixtures, that is used to construct unit masonry assemblies.

**MORTAR, SURFACE-BONDING.** A mixture to bond concrete masonry units that contains hydraulic cement, glass fiber reinforcement with or without inorganic fillers or organic modifiers and water.

**MULTILEVEL ASSEMBLY SEATING.** Seating that is arranged in distinct levels where each level is comprised of either multiple rows, or a single row of box seats accessed from a separate level.

**MULTIPLE-STATION ALARM DEVICE.** Two or more single-station alarm devices that can be interconnected such that actuation of one causes all integral or separate audible alarms to operate. A multiple-station alarm device can consist of one single-station alarm device having connections to other detectors or to a manual fire alarm box.

**MULTIPLE-STATION SMOKE ALARM.** Two or more single-station alarm devices that are capable of interconnection such that actuation of one causes the appropriate alarm signal to operate in all interconnected alarms.

**MULTISTOREY UNIT.** A dwelling unit or sleeping unit with habitable space located on more than one storey.

**NAILING, BOUNDARY.** A special nailing pattern required by design at the boundaries of diaphragms.

**NAILING, EDGE.** A special nailing pattern required by design at the edges of each panel within the assembly of a diaphragm or shear wall.

**NAILING, FIELD.** Nailing required between the sheathing panels and framing members at locations other than boundary nailing and edge nailing.

**NATURALLY DURABLE WOOD.** The heartwood of the following species except for the occasional piece with corner sapwood, provided 90 percent or more of the width of each side on which it occurs is heartwood.

- **Decay resistant.** Redwood, cedar, black locust and black walnut.
- **Termite resistant.** Redwood, Alaska yellow cedar, Eastern red cedar and Western red cedar.

**NOMINAL LOADS.** The magnitudes of the loads specified in Part 16 (dead, live, soil, wind, snow, rain, flood and earthquake).

**NOMINAL SIZE (TIMBER).** The commercial size designation of width and depth, in standard sawn timber and glued-laminated timber grades; somewhat larger than the standard net size of dressed timber, in accordance with Ghana Grading Rules for Square-Edge Sawn Timber.
NONCOMBUSTIBLE MEMBRANE STRUCTURE. A membrane structure in which the membrane and all component parts of the structure are noncombustible.

NONSTRUCTURAL CONCRETE. Any element made of plain or reinforced concrete that is not part of a structural system required to transfer either gravity or lateral loads to the ground.

NORMAL TEMPERATURE AND PRESSURE (NTP). A temperature of 21°C (70°F) and a pressure of 1 atmosphere [14.7 psia (101 kPa)].

NOSING. The leading edge of treads of stairs and of landings at the top of stairway flights.

NUISANCE ALARM. An alarm caused by mechanical failure, malfunction, improper installation or lack of proper maintenance, or an alarm activated by a cause that cannot be determined.

NURSING HOMES. Facilities that provide care, including both intermediate care facilities and skilled nursing facilities where any of the persons are incapable of self-preservation.

OCCUPANT LOAD. The number of persons for which the means of escape of a building or portion thereof is designed.

OCCUPIABLE SPACE. A room or enclosed space designed for human occupancy in which individuals congregate for amusement, educational or similar purposes or in which occupants are engaged at labor, and which is equipped with means of escape and light and ventilation facilities meeting the requirements of this Code.

OPEN PARKING GARAGE. A structure or portion of a structure with the openings as described in this Code on two or more sides that is used for the parking or storage of private motor vehicles as described in this Code.

OPEN SYSTEM. The use of a solid or liquid hazardous material involving a vessel or system that is continuously open to the atmosphere during normal operations and where vapours are liberated, or the product is exposed to the atmosphere during normal operations. Examples of open systems for solids and liquids include dispensing from or into open beakers or containers, dip tank and plating tank operations.

OPEN-AIR ASSEMBLY SEATING. Seating served by means of escape that is not subject to smoke accumulation within or under a structure and is open to the atmosphere.

OPEN-ENDED CORRIDOR. An interior corridor that is open on each end and connects to an exterior stairway or ramp at each end with no intervening doors or separation from the corridor.

OPENING PROTECTIVE. A fire door assembly, fire shutter assembly, fire window assembly or glass-block assembly in a fire-resistance-rated wall or partition.

OPERATING BUILDING. A building occupied in conjunction with the manufacture, transportation or use of explosive materials. Operating buildings are separated from one another with the use of intraplant or intraline distances.

ORTHOGONAL. To be in two horizontal directions, at 90 degrees (1.57 rad) to each other.

OWNER. Any person, agent, operator, entity, firm or corporation having any legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such person, and the executor or administrator of the estate of such person if ordered to take possession of real property by a court.

PANEL (PART OF A STRUCTURE). The clause of a floor, wall or roof comprised between the supporting frame of two adjacent rows of columns and girders or column bands of floor or roof construction.

PANIC HARDWARE. A door-latching assembly incorporating a device that releases the latch upon the application of a force in the direction of escape travel. See "Fire exit hardware."

PARTICLEBOARD. A generic term for a panel primarily composed of cellulosic materials (usually wood), generally in the form of discrete pieces or particles, as distinguished from fibers. The cellulosic material is combined with synthetic resin or other suitable bonding system by a process in which the interparticle bond is created by the bonding system under heat and pressure.
**Penetration Firestop.** A through-penetration firestop or a membrane-penetration firestop.

**Penthouse.** An enclosed, unoccupied rooftop structure used for sheltering mechanical and electrical equipment, tanks, elevators and related machinery, and vertical shaft openings.

**Performance Category.** A designation of wood structural panels as related to the panel performance used in Part 23.

**Permit.** An official document or certificate issued by the Head of Works that authorizes performance of a specified activity.

**Person.** An individual, heirs, executors, administrators or assigns, and also includes a firm, partnership or corporation, its or their successors or assigns, or the agent of any of the aforesaid.

**Personal Care Service.** The care of persons who do not require medical care. Personal care involves responsibility for the safety of the persons while inside the building.

**Photoluminescent.** Having the property of emitting light that continues for a length of time after excitation by visible or invisible light has been removed.

**Photovoltaic Module.** A complete, environmentally protected unit consisting of solar cells, optics and other components, exclusive of tracker, designed to generate DC power when exposed to sunlight.

**Photovoltaic Panel.** A collection of modules mechanically fastened together, wired and designed to provide a field-installable unit.

**Photovoltaic Panel System.** A system that incorporates discrete photovoltaic panels, that converts solar radiation into electricity, including rack support systems.

**Photovoltaic Shingles.** A roof covering resembling shingles that incorporates photovoltaic modules.

**Physical Hazard.** A chemical for which there is evidence that it is a combustible liquid, cryogenic fluid, explosive, flammable (solid, liquid or gas), organic peroxide (solid or liquid), oxidizer (solid or liquid), oxidizing gas, pyrophoric (solid, liquid or gas), unstable (reactive) material (solid, liquid or gas) or water-reactive material (solid or liquid).

**Physiological Warning Threshold Level.** A concentration of airborne contaminants, normally expressed in parts per million (ppm) or milligrams per cubic meter (mg/m³), that represents the concentration at which persons can sense the presence of the contaminant due to odor, irritation or other quick-acting physiological response.

**Plastic, Approved.** Any thermoplastic, thermosetting or reinforced thermosetting plastic material that conforms to combustibility classifications specified in the clause applicable to the application and plastic type.

**Plastic Composite.** A generic designation that refers to wood/plastic composites, plastic timber and similar materials.

**Plastic Glazing.** Plastic materials that are glazed or set in a frame or sash.

**Plastic Timber.** A manufactured product made primarily of plastic materials (filled or unfilled) which is generally rectangular in cross clause.

**Platform.** A raised area within a building used for worship, the presentation of music, plays or other entertainment; the head table for special guests; the raised area for lecturers and speakers; boxing and wrestling rings; theater-in-the-round stages; and similar purposes wherein, other than horizontal sliding curtains, there are no overhead hanging curtains, drops, scenery or stage effects other than lighting and sound. A temporary platform is one installed for not more than 30 days.

**Plot.** A portion or parcel of land considered as a unit.

**Plot Line.** A line dividing one plot from another, or from a street or any public place.

**Polypropylene Siding.** A shaped material, made principally from polypropylene homopolymer, or copolymer, which in some cases contains fillers or reinforcements, that is used to clad exterior walls of buildings.

**Porcelain Tile.** Tile that conforms to the requirements of ISO 13007 and for ceramic tile having an absorption of 0.5 percent or less in accordance with ISO 13007.

**Positive Roof Drainage.** The drainage condition in which consideration has been made for all loading deflections of the roof deck, and additional slope has been provided.
to ensure drainage of the roof within 48 hours of precipitation.

**POWER-ASSISTED DOOR.** Swinging door which opens by reduced pushing or pulling force on the door-operating hardware. The door closes automatically after the pushing or pulling force is released and functions with decreased forces. See “Low-energy power-operated door” and “Power-operated door.”

**POWER-OPERATED DOOR.** Swinging, sliding, or folding door which opens automatically when approached by a pedestrian or opens automatically upon an action by a pedestrian. The door closes automatically and includes provisions such as presence sensors to prevent entrapment. See “Low energy power-operated door” and “Power-assisted door.”

**PREFABRICATED WOOD I-JOIST.** Structural member manufactured using sawn or structural composite timber flanges and wood structural panel webs bonded together with exterior exposure adhesives, which forms an “I” cross-clauseal shape.

**PRESTRESSED MASONRY.** Masonry in which internal stresses have been introduced to counteract potential tensile stresses in masonry resulting from applied loads.

**PRIMARY STRUCTURAL FRAME.** The primary structural frame shall include all of the following structural members:

1. The columns.
2. Structural members having direct connections to the columns, including girders, beams, trusses and spandrels.
3. Members of the floor construction and roof construction having direct connections to the columns.
4. Bracing members that are essential to the vertical stability of the primary structural frame under gravity loading shall be considered part of the primary structural frame whether or not the bracing member carries gravity loads.

**PRIVATE GARAGE.** A building or portion of a building in which motor vehicles used by the owner or tenants of the building or buildings on the premises are stored or kept, without provisions for repairing or servicing such vehicles for profit.

**PROSCENIUM WALL.** The wall that separates the stage from the auditorium or assembly seating area.

**PUBLIC ENTRANCE.** An entrance that is not a service entrance or a restricted entrance.

**PUBLIC WAY.** A street, alley or other parcel of land open to the outside air leading to a street, that has been deeded, dedicated or otherwise permanently appropriated to the public for public use and which has a clear width and height of not less than 3048 mm (10 feet).

**PUBLIC-USE AREAS.** Interior or exterior rooms or spaces that are made available to the general public.

**PYROPHORIC.** A chemical with an auto-ignition temperature in air, at or below a temperature of 54.4°C (130°F).

**PYROTECHNIC COMPOSITION.** A chemical mixture that produces visible light displays or sounds through a self-propagating, heat-releasing chemical reaction which is initiated by ignition.

**RADIANT BARRIER.** A material having a low-emittance surface of 0.1 or less installed in building assemblies.

**RAMP.** A walking surface that has a running slope steeper than one unit vertical in 20 units horizontal (5-percent slope).

**RAMP-ACCESS OPEN PARKING GARAGES.** Open parking garages employing a series of continuously rising floors or a series of interconnecting ramps between floors permitting the movement of vehicles under their own power from and to the street level.

**RECORD DRAWINGS.** Drawings (“as built”) that document the location of all devices, appliances, wiring sequences, wiring methods and connections of the components of a fire alarm system as installed.

**REFLECTIVE PLASTIC CORE INSULATION.** An insulation material packaged in rolls, that is less than 12.7 mm ($\frac{1}{2}$ inch) thick, with not less than one exterior low-emittance surface (0.1 or less) and a core material containing voids or cells.

**REGISTERED DESIGN PROFESSIONAL.** An individual who is registered or licensed to practice their respective design profession as defined by the statutory requirements of the
professional registration IEN 310 of the state or jurisdiction in which the project is to be constructed.

REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE. A registered design professional engaged by the owner or the owner’s authorized agent to review and coordinate certain aspects of the project, as determined by the Head of Works, for compatibility with the design of the building or structure, including Submission documents prepared by others, deferred Submission documents and phased Submission documents.

RELIGIOUS WORSHIP, PLACE OF. A building or portion thereof intended for the performance of religious services.

RELOCATABLE BUILDING. A partially or completely assembled building constructed and designed to be reused multiple times and transported to different building sites.

REPAIR. The reconstruction, replacement or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.

REPAIR GARAGE. A building, structure or portion thereof used for servicing or repairing motor vehicles.

REROOFING. The process of recovering or replacing an existing roof covering. See “Roof recover” and “Roof replacement.”

RESIDENTIAL AIRCRAFT HANGAR. An accessory building less than 18 m \(^2\) (62,000 square feet) and 6096 mm (20 feet) in building height constructed on a one- or two-family property where aircraft are stored. Such use will be considered as a residential accessory use incidental to the dwelling.

RESISTANCE FACTOR. A factor that accounts for deviations of the actual strength from the nominal strength and the manner and consequences of failure (also called “strength reduction factor”).

RESTRICTED ENTRANCE. An entrance that is made available for common use on a controlled basis, but not public use, and that is not a service entrance.

RETRACTABLE AWNING. A retractable awning is a cover with a frame that retracts against a building or other structure to which it is entirely supported.

RISK CATEGORY. A categorization of buildings and other structures for determination of flood, wind, snow, ice and earthquake loads based on the risk associated with unacceptable performance.

RISK-TARGETED MAXIMUM CONSIDERED EARTHQUAKE (MCE) GROUND MOTION RESPONSE ACCELERATIONS. The most severe earthquake effects considered by this Code, determined for the orientation that results in the largest maximum response to horizontal ground motions and with adjustment for targeted risk.

ROOF ASSEMBLY (For application to Part 15 only). A system designed to provide weather protection and resistance to design loads. The system consists of a roof covering and roof deck or a single component serving as both the roof covering and the roof deck. A roof assembly can include an underlayment, a thermal barrier, insulation or a vapour retarder.

ROOF COATING. A fluid-applied, adhered coating used for roof maintenance or roof repair, or as a component of a roof covering system or roof assembly.

ROOF COVERING. The covering applied to the roof deck for weather resistance, fire classification or appearance.

ROOF DECK. The flat or sloped surface constructed on top of the exterior walls of a building or other supports for the purpose of enclosing the storey below, or sheltering an area, to protect it from the elements, not including its supporting members or vertical supports.

ROOF RECOVER. The process of installing an additional roof covering over a prepared existing roof covering without removing the existing roof covering.

ROOF REPAIR. Reconstruction or renewal of any part of an existing roof for the purposes of its maintenance.

ROOF REPLACEMENT. The process of removing the existing roof covering, repairing any damaged substrate and installing a new roof covering.

ROOF VENTILATION. The natural or mechanical process of supplying conditioned or unconditioned air to, or removing such air from,
attics, cathedral ceilings or other enclosed spaces over which a roof assembly is installed.

**ROOFTOP STRUCTURE.** A structure erected on top of the roof deck or on top of any part of a building.

**RUNNING BOND.** The placement of masonry units such that head joints in successive courses are horizontally offset at least one-quarter the unit length.

**SALLYPORT.** A security vestibule with two or more doors or gates where the intended purpose is to prevent continuous and unobstructed passage by allowing the release of only one door or gate at a time.

**SCISSOR STAIRWAY.** Two interlocking stairways providing two separate paths of escape located within one exit enclosure.

**SCUPPER.** An opening in a wall or parapet that allows water to drain from a roof.

**SECONDARY MEMBERS.** The following structural members shall be considered secondary members and not part of the primary structural frame:

1. Structural members not having direct connections to the columns.
2. Members of the floor construction and roof construction not having direct connections to the columns.
3. Bracing members other than those that are part of the primary structural frame.

**SEISMIC DESIGN CATEGORY.** A classification assigned to a structure based on its risk category and the severity of the design earthquake ground motion at the site.

**SEISMIC FORCE-RESISTING SYSTEM.** That part of the structural system that has been considered in the design to provide the required resistance to the prescribed seismic forces.

**SELF-CLOSING.** As applied to a fire door or other opening protective, means equipped with an device that will ensure closing after having been opened.

**SELF-LUMINOUS.** Illuminated by a self-contained power source, other than batteries, and operated independently of external power sources.

**SELF-SERVICE STORAGE FACILITY.** Real property designed and used for the purpose of renting or leasing individual storage spaces to customers for the purpose of storing and removing personal property on a self-service basis.

**SERVICE CORRIDOR.** A fully enclosed passage used for transporting HPM and purposes other than required means of escape.

**SERVICE ENTRANCE.** An entrance intended primarily for delivery of goods or services.

**SHAFT.** An enclosed space extending through one or more stories of a building, connecting vertical openings in successive floors, or floors and roof.

**SHAFT ENCLOSURE.** The walls or construction forming the boundaries of a shaft.

**SHALLOW FOUNDATION.** A shallow foundation is an individual or strip footing, a mat foundation, a slab-on-grade foundation or a similar foundation element.

**SHEAR WALL** (for Part 23). A wall designed to resist lateral forces parallel to the plane of a wall.

Shear wall, perforated. A wood structural panel sheathed wall with openings, that has not been specifically designed and detailed for force transfer around openings.

Shear wall segment, perforated. A clause of shear wall with full-height sheathing that meets the height-to-width ratio limits of Clause 4.3.4 of AWC SDPWS.

**SHINGLE FASHION.** A method of installing roof or wall coverings, water-resistive barriers, flashing or other building components such that upper layers of material are placed overlapping lower layers of material to provide for drainage via gravity and moisture control.

**SINGLE-PLY MEMBRANE.** A roofing membrane that is field applied using one layer of membrane material (either homogeneous or composite) rather than multiple layers.

**SINGLE-STATION SMOKE ALARM.** An assembly incorporating the detector, the control equipment and the alarm-sounding device in one unit, operated from a power supply either in the unit or obtained at the point of installation.
SITE. A parcel of land bounded by a plot line or a designated portion of a public right-of-way.

SKYLIGHT, UNIT. A factory-assembled, glazed fenestration unit, containing one panel of glazing material that allows for natural lighting through an opening in the roof assembly while preserving the weather-resistant barrier of the roof.

SKYLIGHTS AND SLOPED GLAZING. Glass or other transparent or translucent glazing material installed at a slope of 15 degrees (0.26 rad) or more from vertical. Unit skylights, tubular daylighting devices, glazing materials, solariums, sunrooms, roofs and sloped walls are included in this definition.

SLEEPING UNIT. A single unit that provides rooms or spaces for one or more persons, includes permanent provisions for sleeping and can include provisions for living, eating and either sanitation or kitchen facilities but not both. Such rooms and spaces that are also part of a dwelling unit are not sleeping units.

SMOKE ALARM. A single- or multiple-station alarm responsive to smoke. See “Multiple-station smoke alarm” and “Single-station smoke alarm.”

SMOKE BARRIER. A continuous membrane, either vertical or horizontal, such as a wall, floor or ceiling assembly, that is designed and constructed to restrict the movement of smoke.

SMOKE COMPARTMENT. A space within a building enclosed by smoke barriers on all sides, including the top and bottom.

SMOKE DAMPER. A listed device installed in ducts and air transfer openings designed to resist the passage of smoke. The device is installed to operate automatically, controlled by a smoke detection system, and where required, is capable of being positioned from a fire command center.

SMOKE DETECTOR. A listed device that senses visible or invisible particles of combustion.

SMOKE PARTITION. A wall assembly that extends from the top of the foundation or floor below to the underside of the floor or roof sheathing, deck or slab above or to the underside of the ceiling above where the ceiling membrane is constructed to limit the transfer of smoke.

SMOKE-DEVELOPED INDEX. A comparative measure, expressed as a dimensionless number, derived from measurements of smoke obscuration versus time for a material tested in accordance with ASTM E84.

SMOKEPROOF ENCLOSURE. An exit stairway or ramp designed and constructed so that the movement of the products of combustion produced by a fire occurring in any part of the building into the enclosure is limited.

SMOKE-PROTECTED ASSEMBLY SEATING. Seating served by means of escape that is not subject to smoke accumulation within or under a structure for a specified design time by means of passive design or by mechanical ventilation.

SOFT CONTAINED PLAY EQUIPMENT STRUCTURE. A children’s play structure containing one or more components where the user enters a play environment that utilizes pliable materials.

SOLID. A material that has a melting point, decomposes or sublimes at a temperature greater than 20°C (68°F).

SPECIAL AMUSEMENT BUILDING. A special amusement building is any temporary or permanent building or portion thereof that is occupied for amusement, entertainment or educational purposes and that contains a device or system that conveys passengers or provides a walkway along, around or over a course in any direction so arranged that the means of escape path is not readily apparent due to visual or audio distractions or is intentionally confounded or is not readily available because of the nature of the attraction or mode of conveyance through the building or structure.

SPECIAL INSPECTION. Inspection of construction requiring the expertise of an approved special inspector in order to ensure compliance with this Code and the approved construction documents.

Continuous special inspection. Special inspection by the special inspector who is present continuously when and where the work to be inspected is being performed.

Periodic special inspection. Special inspection by the special inspector who is intermittently present where the work to be inspected has been or is being performed.
SPECIAL INSPECTOR. A qualified person employed or retained by an approved agency and approved by the Head of Works as having the competence necessary to inspect a particular type of construction requiring special inspection.

SPECIFIED COMPRRESSIVE STRENGTH OF MASONRY, f’m. Minimum compressive strength, expressed as force per unit of net cross-clauseal area, required of the masonry used in construction by the approved construction documents, and upon which the project design is based. Whenever the quantity f’ is under the radical sign, the square root of m numerical value only is intended and the result has units of pounds per square inch (psi) (MPa).

SPICE. The result of a factory and/or field method of joining or connecting two or more lengths of a fire-resistant joint system into a continuous entity.

SPRAY ROOM. A room designed to accommodate spraying operations.

SPRAYED FIRE-RESISTANT MATERIALS. Cementitious or fibrous materials that are sprayed to provide fire-resistant protection of the substrates.

STAGE. A space within a building utilized for entertainment or presentations, which includes overhead hanging curtains, drops, scenery or stage effects other than lighting and sound.

STAIR. A change in elevation, consisting of one or more risers.

STAIRWAY. One or more flights of stairs, either exterior or interior, with the necessary landings and platforms connecting them, to form a continuous and uninterrupted passage from one level to another.

STAIRWAY, SPIRAL. A stairway having a closed circular form in its plan view with uniform clause-shaped treads attached to and radiating from a minimum-diameter supporting column.

STANDBY POWER SYSTEM. A source of automatic electric power of a required capacity and duration to operate required building, hazardous materials or ventilation systems in the event of a failure of the primary power. Standby power systems are required for electrical loads where interruption of the primary power could create hazards or hamper rescue or fire-fighting operations.

START OF CONSTRUCTION. The date of permit issuance for new construction and substantial improvements to existing structures, provided the actual start of construction, repair, reconstruction, rehabilitation, addition, placement or other improvement is within 180 days after the date of issuance. The actual start of construction means the first placement of permanent construction of a building (including a manufactured home) on a site, such as the pouring of a slab or footings, installation of pilings or construction of columns.

STEEL CONSTRUCTION, COLD-FORMED. That type of construction made up entirely or in part of steel structural members cold formed to shape from sheet or strip steel such as roof deck, floor and wall panels, studs, floor joists, roof joists and other structural elements.

STEEL ELEMENT, STRUCTURAL. Any steel structural member of a building or structure consisting of rolled shapes, pipe, hollow structural clauses, plates, bars, sheets, rods or steel castings other than cold-formed steel or steel joist members.

STEEL JOIST. Any steel structural member of a building or structure made of hot-rolled or cold-formed solid or open-web clauses, or riveted or welded bars, strip or sheet steel members, or splotted and expanded, or otherwise deformed rolled clauses.

STEEP SLOPE. A roof slope greater than two units vertical in 12 units horizontal (17-percent slope).

STONE MASONRY. Masonry composed of field, quarried or cast stone units bonded by mortar.

STORAGE, HAZARDOUS MATERIALS. The keeping, retention or leaving of hazardous materials in closed containers, tanks, cylinders, or similar vessels; or vessels supplying operations through closed connections to the vessel.

STORAGE RACKS. Cold-formed or hot-rolled steel structural members which are formed into steel storage racks, including pallet storage racks, movable-shelf racks, rack-supported systems, automated storage and retrieval systems (stacker racks), push-back racks, pallet-flow racks, case-flow racks, pick modules and rack-supported platforms. Other types of racks, such as drive-in or drive-through racks, cantilever racks, portable racks or racks made of materials other than steel, are not
considered storage racks for the purpose of this Code.

**STORM SHELTER.** A building, structure or portions thereof, constructed in accordance with this Code and designated for use during a severe wind storm event.

**Community storm shelter.** A storm shelter not defined as a “Residential storm shelter.”

**Residential storm shelter.** A storm shelter serving occupants of dwelling units and having an occupant load not exceeding 16 persons.

**STOREY.** That portion of a building included between the upper surface of a floor and the upper surface of the floor or roof next above (see “Basement,” “Building height,” “Grade plane” and “Mezzanine”). A storey is measured as the vertical distance from top to top of two successive tiers of beams or finished floor surfaces and, for the topmost storey, from the top of the floor finish to the top of the ceiling joists or, where there is not a ceiling, to the top of the roof rafters.

**STOREY ABOVE GRADE PLANE.** Any storey having its finished floor surface entirely above grade plane, or in which the finished surface of the floor next above is:

1. More than 1829 mm (6 feet) above grade plane; or
2. More than 3658 mm (12 feet) above the finished ground level at any point.

**STRUCTURAL COMPOSITE TIMBER.** Structural member manufactured using wood elements bonded together with exterior adhesives. Examples of structural composite timber are:

**Laminated strand timber (LST).** A composite of wood strand elements with wood fibers primarily oriented along the length of the member, where the least dimension of the wood strand elements is 0.10 inch (2.54 mm) or less and their average lengths not less than 150 times the least dimension of the wood strand elements.

**Laminated veneer timber (LVT).** A composite of wood veneer sheet elements with wood fibers primarily oriented along the length of the member, where the veneer element thicknesses are 6.4 mm (0.25 inches) or less.

**Oriented strand timber (OST).** A composite of wood strand elements with wood fibers primarily oriented along the length of the member, where the least dimension of the wood strand elements is 2.54 mm (0.10 inches) or less and their average lengths not less than 75 times and less than 150 times the least dimension of the strand elements.

**Parallel strand timber (PST).** A composite of wood strand elements with wood fibers primarily oriented along the length of the member where the least dimension of the wood strand elements is 6.4 mm (0.25 inches) or less and their average lengths not less than 300 times the least dimension of the wood strand elements.

**STRUCTURAL GLUED-LAMINATED TIMBER.** An engineered, stress-rated product of a timber laminating plant, comprised of assemblies of specially selected and prepared wood laminations in which the grain of all laminations is approximately parallel longitudinally and the laminations are bonded with adhesives.

**STRUCTURAL OBSERVATION.** The visual observation of the structural system by a registered design professional for general conformance to the approved construction documents.

**STRUCTURE.** That which is built or constructed.

**SUBSTANTIAL DAMAGE.** Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before-damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred.

**SUBSTANTIAL IMPROVEMENT.** Any repair, reconstruction, rehabilitation, alteration, addition or other improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the improvement or repair is started. If the structure has sustained substantial damage, any repairs are considered substantial improvement regardless of the actual repair work performed. The term does not, however, include either:

1. Any project for improvement of a building required to correct existing
health, sanitary or safety Code violations identified by the Head of Works and that are the minimum necessary to assure safe living conditions.

2. Any alteration of a historic structure provided that the alteration will not preclude the structure’s continued designation as a historic structure.

SUPERVISING STATION. A facility that receives signals and at which personnel are in attendance at all times to respond to these signals.

SUPERVISORY SERVICE. The service required to monitor performance of guard tours and the operative condition of fixed suppression systems or other systems for the protection of life and property.

SUPERVISORY SIGNAL. A signal indicating the need of action in connection with the supervision of guard tours, the fire suppression systems or equipment or the maintenance features of related systems.

SUPERVISORY SIGNAL-INITIATING DEVICE. An initiation device, such as a valve supervisory switch, water-level indicator or low-air pressure switch on a dry-pipe sprinkler system, whose change of state signals an off-normal condition and its restoration to normal of a fire protection or life safety system, or a need for action in connection with guard tours, fire suppression systems or equipment or maintenance features of related systems.

SUSCEPTIBLE BAY. A roof or portion thereof with either of the following:

1. A slope less than \( \frac{1}{4} \) -inch per foot (0.0208 rad).

2. On which water is impounded, in whole or in part, and the secondary drainage system is functional but the primary drainage system is blocked.

A roof surface with a slope of \( \frac{1}{4} \) -inch per foot (0.0208 rad) or greater towards points of free drainage is not a susceptible bay.

SWIMMING POOL. Any structure intended for swimming, recreational bathing or wading that contains water over 610 mm (24 inches) deep. This includes in-ground, above-ground and on-ground pools; hot tubs; spas and fixed-in-place wading pools.

TECHNICAL PRODUCTION AREA. Open elevated areas or spaces intended for entertainment technicians to walk on and occupy for servicing and operating entertainment technology systems and equipment. Galleries, including fly and lighting galleries, gridirons, catwalks, and similar areas are designed for these purposes.

TENSILE MEMBRANE STRUCTURE. A membrane structure having a shape that is determined by tension in the membrane and the geometry of the support structure. Typically, the structure consists of both flexible elements (e.g., membrane and cables), nonflexible elements (e.g., struts, masts, beams and arches) and the anchorage (e.g., supports and foundations). This includes frame-supported tensile membrane structures.

TENT. A structure, enclosure, umbrella structure or shelter, with or without sidewalls or drops, constructed of fabric or pliable material supported in any manner except by air or the contents it protects (see “Umbrella structure”).

THERMAL ISOLATION. A separation of conditioned spaces, between a sunroom and a dwelling unit, consisting of existing or new walls, doors or windows.

THERMOPLASTIC MATERIAL. A plastic material that is capable of being repeatedly softened by increase of temperature and hardened by decrease of temperature.

THERMOSETTING MATERIAL. A plastic material that is capable of being changed into a substantially nonreformable product when cured.

THROUGH PENETRATION. A breach in both sides of a floor, floor-ceiling or wall assembly to accommodate an item passing through the breaches.

THROUGH-PENETRATION FIRESTOP SYSTEM. An assemblage consisting of a fire-resistance-rated floor, floor-ceiling, or wall assembly, one or more penetrating items passing through the breaches in both sides of the assembly and the materials or devices, or both, installed to resist the spread of fire through the assembly for a prescribed period of time.
TIE, WALL. Metal connector that connects wythes of masonry walls together.

TIE-DOWN (HOLD-DOWN). A device used to resist uplift of the chords of shear walls.

TILE, STRUCTURAL CLAY. A hollow masonry unit composed of burned clay, shale, fire clay or mixture thereof, and having parallel cells.

TIRES, BULK STORAGE OF. Storage of tires where the area available for storage exceeds 3\textsuperscript{2} 20,000 cubic feet (566 m\textsuperscript{3}).

TOWNHOUSE. A single-family dwelling unit constructed in a group of three or more attached units in which each unit extends from the foundation to roof and with open space on at least two sides.

TOXIC. A chemical falling within any of the following categories:

1. A chemical that has a median lethal dose (LD\textsubscript{50}) of more than 50 milligrams per kilogram, but not more than 500 milligrams per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.

2. A chemical that has a median lethal dose (LD\textsubscript{50}) of more than 200 milligrams per kilogram, but not more than 1,000 milligrams per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.

3. A chemical that has a median lethal concentration (LC\textsubscript{50}) in air of more than 50 parts per million, but not more than 2,000 parts per million by volume of gas or vapour, or more than 2 milligrams per liter but not more than 20 milligrams per liter of mist, fume or dust, when administered by continuous inhalation for 1 hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

TRANSIENT. Occupancy of a dwelling unit or sleeping unit for not more than 30 days.

TRANSIENT AIRCRAFT. Aircraft based at another location and that is at the transient location for not more than 90 days.

TREATED WOOD. Wood products that are conditioned to enhance fire-retardant or preservative properties.

Fire-retardant-treated wood. Wood products that, when impregnated with chemicals by a pressure process or other means during manufacture, exhibit reduced surface-burning characteristics and resist propagation of fire.

Preservative-treated wood. Wood products that, conditioned with chemicals by a pressure process or other means, exhibit reduced susceptibility to damage by fungi, insects or marine borers.

TRIM. Picture molds, chair rails, baseboards, handrails, door and window frames and similar decorative or protective materials used in fixed applications.

TROUBLE SIGNAL. A signal initiated by the fire alarm system or device indicative of a fault in a monitored circuit or component.

TUBULAR DAYLIGHTING DEVICE (TDD). A non-operable fenestration unit primarily designed to transmit daylight from a roof surface to an interior ceiling via a tubular conduit. The basic unit consists of an exterior glazed weathering surface, a light-transmitting tube with a reflective interior surface, and an interior-sealing device such as a translucent ceiling panel. The unit can be factory assembled, or field-assembled from a manufactured kit.

UMBRELLA STRUCTURE. A structure, enclosure or shelter with or without sidewalls or drops, constructed of fabric or pliable material supported by a central pole or poles (see “Tent”).

UNDERLAYERMENT. One or more layers of a material that is applied to a steep-slope roof covering deck under the roof covering and resists liquid water that penetrates the roof covering.

UNSTABLE (REACTIVE) MATERIAL. A material, other than an explosive, which in the pure state or as commercially produced, will vigorously polymerize, decompose, condense or become self-reactive and undergo other violent chemical changes, including explosion, when exposed to heat, friction or shock, or in
the absence of an inhibitor, or in the presence of contaminants, or in contact with incompatible materials. Unstable (reactive) materials are subdivided as follows:

**Class 4.** Materials that in themselves are readily capable of detonation or explosive decomposition or explosive reaction at normal temperatures and pressures. This class includes materials that are sensitive to mechanical or localized thermal shock at normal temperatures and pressures.

**Class 3.** Materials that in themselves are capable of detonation or of explosive decomposition or explosive reaction but which require a strong initiating source or which must be heated under confinement before initiation. This class includes materials that are sensitive to thermal or mechanical shock at elevated temperatures and pressures.

**Class 2.** Materials that in themselves are normally unstable and readily undergo violent chemical change but do not detonate. This class includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures, and that can undergo violent chemical change at elevated temperatures and pressures.

**Class 1.** Materials that in themselves are normally stable but which can become unstable at elevated temperatures and pressure.

**VAPOUR PERMEABLE.** The property of having a moisture vapour permeance rating of
\[10^{-5} \text{ perms} \ (2.9 \times 10^{-12} \text{ kg/Pa} \times \text{s} \times \text{m}^2)\] or greater, when tested in accordance with the desiccant method using Procedure A of ASTM E96. A vapour permeable material permits the passage of moisture vapour.

**VAPOUR RETARDER CLASS.** A measure of a material or assembly's ability to limit the amount of moisture that passes through that material or assembly. Vapour retarder class shall be defined using the desiccant method with Procedure A of ASTM E96 as follows:

**Class I:** 0.1 perm or less.

**Class II:** 0.1 < perm ≤ 1.0 perm.

**Class III:** 1.0 < perm ≤ 10 perm.

**VEGETATIVE ROOF.** An assembly of interacting components designed to waterproof a building's top surface that includes, by design, vegetation and related landscape elements.

**VEHICLE BARRIER.** A component or a system of components, near open sides or walls of garage floors or ramps that act as a restraint for vehicles.

**VEHICULAR GATE.** A gate that is intended for use at a vehicular entrance or exit to a facility, building or portion thereof, and that is not intended for use by pedestrian traffic.

**VENEER.** A facing attached to a wall for the purpose of providing ornamentation, protection or insulation, but not counted as adding strength to the wall.

**VENTILATION.** The natural or mechanical process of supplying conditioned or unconditioned air to, or removing such air from, any space.

**VINYL SIDING.** A shaped material, made principally from rigid polyvinyl chloride (PVC), that is used as an exterior wall covering.

**VISIBLE ALARM NOTIFICATION APPLIANCE.** A notification appliance that alerts by the sense of sight.

**WALKWAY, PEDESTRIAN.** A walkway used exclusively as a pedestrian trafficway.

**WALL (for Part 22).** A vertical element with a horizontal length-to-thickness ratio greater than three, used to enclose space.

**Cavity wall.** A wall built of masonry units or of concrete, or a combination of these materials, arranged to provide an airspace within the wall, and in which the inner and outer parts of the wall are tied together with metal ties.

**Dry-stacked, surface-bonded wall.** A wall built of concrete masonry units where the units are stacked dry, without mortar on the bed or head joints, and where both sides of the wall are coated with a surface-bonding mortar.

**Parapet wall.** The part of any wall entirely above the roof line.

**WALL, LOAD-BEARING.** Any wall meeting either of the following classifications:

1. Any metal or wood stud wall that supports more than 100 pounds per
linear foot (1459 N/m) of vertical load in addition to its own weight.

2. Any masonry or concrete wall that supports more than 200 pounds per linear foot (2919 N/m) of vertical load in addition to its own weight.

WALL, NONLOAD-BEARING. Any wall that is not a load-bearing wall.

WATER-REACTIVE MATERIAL. A material that explodes; violently reacts; produces flammable, toxic or other hazardous gases; or evolves enough heat to cause autoignition or ignition of combustibles upon exposure to water or moisture. Water-reactive materials are subdivided as follows:

   Class 3. Materials that react explosively with water without requiring heat or confinement.
   Class 2. Materials that react violently with water or have the ability to boil water. Materials that produce flammable, toxic or other hazardous gases or evolve enough heat to cause autoignition or ignition of combustibles upon exposure to water or moisture.
   Class 1. Materials that react with water with some release of energy, but not violently.

WATER-RESISTIVE BARRIER. A material behind an exterior wall covering that is intended to resist liquid water that has penetrated behind the exterior covering from further intruding into the exterior wall assembly.

WEATHER-EXPOSED SURFACES. Surfaces of walls, ceilings, floors, roofs, soffits and similar surfaces exposed to the weather except the following:

1. Ceilings and roof soffits enclosed by walls, fascia, bulkheads or beams that extend not less than 305 mm (12 inches) below such ceiling or roof soffits.
2. Walls or portions of walls beneath an unenclosed roof area, where located a horizontal distance from an open exterior opening equal to not less than twice the height of the opening.
3. Ceiling and roof soffits located a minimum horizontal distance of 3048 mm (10 feet) from the outer edges of the ceiling or roof soffits.

WET-CHEMICAL EXTINGUISHING SYSTEM. A solution of water and potassium-carbonate-based chemical, potassium-acetate-based chemical or a combination thereof, forming an extinguishing agent.

WHEELCHAIR SPACE. A space for a single wheelchair and its occupant.

WINDER. A tread with nonparallel edges.

WIRE BACKING. Horizontal strands of tautened wire attached to surfaces of vertical supports which, when covered with the building paper, provide a backing for cement plaster.

WIRELESS PROTECTION SYSTEM. A system or a part of a system that can transmit and receive signals without the aid of wire.

WOOD/PLASTIC COMPOSITE. A composite material made primarily from wood or cellulose-based materials and plastic.

WOOD SHEAR PANEL. A wood floor, roof or wall component sheathed to act as a shear wall or diaphragm.

WOOD STRUCTURAL PANEL. A panel manufactured from veneers, wood strands or wafers or a combination of veneer and wood strands or wafers bonded together with waterproof synthetic resins or other suitable bonding systems. Examples of wood structural panels are:

   Composite panels. A wood structural panel that is comprised of wood veneer and reconstituted wood-based material and bonded together with waterproof adhesive.

Oriented strand board (OSB). A mat-formed wood structural panel comprised of thin rectangular wood strands arranged in cross-aligned layers with surface layers normally arranged in the long panel direction and bonded with waterproof adhesive.

Plywood. A wood structural panel comprised of plies of wood veneer arranged in cross-aligned layers. The plies are bonded with waterproof adhesive that cures on application of heat and pressure.

WORKSTATION. A defined space or an independent principal piece of equipment using HPM within a fabrication area where a specific function, laboratory procedure or research activity occurs. Approved or listed hazardous
materials storage cabinets, flammable liquid storage cabinets or gas cabinets serving a workstation are included as part of the workstation. A workstation is allowed to contain ventilation equipment, fire protection devices, detection devices, electrical devices and other processing and scientific equipment.

**WYTHE.** Each continuous, vertical clause of a wall, one masonry unit in thickness.

**YARD.** An open space, other than a court, unobstructed from the ground to the sky, except where specifically provided by this Code, on the plot on which a building is situated.

**ZONE.** A defined area within the protected premises. A zone can define an area from which a signal can be received, an area to which a signal can be sent or an area in which a form of control can be executed.

**ZONE, NOTIFICATION.** An area within a building or facility covered by notification appliances which are activated simultaneously.
PART 3: OCCUPANCY CLASSIFICATION AND USE

User note:
About this part: Part 3 provides the criteria by which buildings and structures are classified into use groups and occupancies. Through the balance of the Code, occupancy classification is fundamental in the setting of features of construction; occupant safety requirements, especially building limitations; means of escape; fire protection systems; and interior finishes.

3.1 SCOPE

3.1.1 General.
The provisions of this part shall control the classification of all buildings and structures as to occupancy and use. Different classifications of occupancy and use represent varying levels of hazard and risk to building occupants and adjacent properties.

3.2 OCCUPANCY CLASSIFICATION AND USE DESIGNATION

3.2.1 Occupancy classification.
Occupancy classification is the formal designation of the primary purpose of the building, structure or portion thereof. Structures shall be classified into one or more of the occupancy groups listed in this clause based on the nature of the hazards and risks to building occupants generally associated with the intended purpose of the building or structure. An area, room or space that is intended to be occupied at different times for different purposes shall comply with all applicable requirements associated with such potential multipurpose. Structures containing multiple occupancy groups shall comply with this Code. Where a structure is proposed for a purpose that is not specifically listed in this clause, such structure shall be classified in the occupancy it most nearly resembles based on the fire safety and relative hazard. Occupied roofs shall be classified in the group that the occupancy most nearly resembles, according to the fire safety and relative hazard, and shall comply with this Code.

2. Business Clause 3.4 Group B.
3. Educational Clause 3.5 Group E.
7. Mercantile Clause 3.9 Group M.
10. Utility and Miscellaneous Clause 3.12 Group U.

3.2.2 Use designation.
Occupancy groups contain subordinate uses having similar hazards and risks to building occupants. Uses include, but are not limited to, those functional designations listed within the occupancy group descriptions in Clause 3.2.1. Certain uses require specific limitations and controls in accordance with the provisions of part 4 and else where in this Code.

3.3 ASSEMBLY GROUP A

3.3.1 Assembly Group A.
Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

3.3.1.1 Small buildings and tenant spaces.
A building or tenant space used for assembly purposes with an occupant load of less than 50 persons shall be classified as a Group B occupancy.

3.3.1.2 Small assembly spaces.
The following rooms and spaces shall not be classified as Assembly occupancies:

1. A room or space used for assembly purposes with an occupant load of less than 50 persons and accessory to another occupancy shall be classified as a Group B
occupancy or as part of that occupancy.

2. A room or space used for assembly purposes that is less than 70 m² (750 square feet) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.

3.3.1.3 Associated with Group E occupancies.
A room or space used for assembly purposes that is associated with a Group E occupancy is not considered a separate occupancy.

3.3.1.4 Accessory to places of religious worship.
Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 per room or space are not considered separate occupancies.

3.3.2 Assembly Group A-1.
Group A-1 occupancy includes assembly uses, usually with fixed seating, intended for the production and viewing of the performing arts or motion pictures including, but not limited to:

- Motion picture theaters
- Symphony and concert halls
- Television and radio studios admitting an audience
- Theaters

3.3.3 Assembly Group A-2.
Group A-2 occupancy includes assembly uses intended for food and/or drink consumption including, but not limited to:

- Banquet halls
- Casinos (gaming areas)
- Nightclubs
- Restaurants, cafeterias and similar dining facilities (including associated commercial kitchens)
- Taverns and bars

3.3.4 Assembly Group A-3.
Group A-3 occupancy includes assembly uses intended for worship, recreation or amusement and other assembly uses not classified elsewhere in Group A including, but not limited to:

- Amusement arcades
- Art galleries
- Bowling alleys
- Community halls
- Courtrooms
- Dance halls (not including food or drink consumption)
- Exhibition halls
- Funeral parlors
- Greenhouses for the conservation and exhibition of plants that provide public access.
- Gymnasiums (without spectator seating)
- Indoor swimming pools (without spectator seating)
- Indoor tennis courts (without spectator seating)
- Lecture halls
- Libraries
- Museums
- Places of religious worship
- Pool and billiard parlors
- Waiting areas in transportation terminals

3.3.5 Assembly Group A-4.
Group A-4 occupancy includes assembly uses intended for viewing of indoor sporting events and activities with spectator seating including, but not limited to:

- Arenas
- Skating rinks
- Swimming pools
- Tennis courts

3.3.6 Assembly Group A-5.
Group A-5 occupancy includes assembly uses intended for participation in or viewing outdoor activities including, but not limited to:

- Amusement park structures
- Bleachers
- Grandstands
- Stadiums

3.4 BUSINESS GROUP B

3.4.1 Business Group B.
Business Group B occupancy includes, among others, the use of a building or structure, or a portion thereof, for office, professional or service-type transactions, including storage of records and accounts. Business occupancies shall include, but not be limited to, the following:

- Airport traffic control towers
- Ambulatory care facilities
- Animal hospitals, kennels and pounds
- Banks
- Barber and beauty shops
- Car wash
- Civic administration
- Clinic, outpatient
Dry cleaning and laundries: pick-up and delivery stations and self-service.
Educational occupancies for students above the 12th grade.
Electronic data processing
Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining facilities not more than 232 m² (2,500 square feet) in area.
Laboratories: testing and research
Motor vehicle showrooms
Post offices
Print shops
Professional services (architects, attorneys, dentists, physicians, engineers, etc.).
Radio and television stations
Telephone exchanges
Training and skill development not in a school or academic program (this shall include, but not be limited to, tutoring centers, martial arts studios, gymnastics and similar uses regardless of the ages served, and where not classified as a Group A occupancy).

3.5 EDUCATIONAL GROUP E

3.5.1 Educational Group E.
Educational Group E occupancy includes, among others, the use of a building or structure, or a portion thereof, by six or more persons at any one time for educational purposes through the 12th grade.

3.5.2 Accessory to places of religious worship.
Religious educational rooms and religious auditoriums, which are accessory to places of religious worship in accordance with Clause 3.3.1.4 and have occupant loads of less than 100 per room or space, shall be classified as Group A-3 occupancies.

3.5.2.2 Five or fewer children.
A facility having five or fewer children receiving such day care shall be classified as part of the primary occupancy.

3.5.2.3 Five or fewer children in a dwelling unit.
A facility such as the above within a dwelling unit and having five or fewer children receiving such day care shall be classified as a Group R-3 occupancy or shall comply with this Code.

3.6 FACTORY GROUP F

3.6.1 Factory Industrial Group F.
Factory Industrial Group F occupancy includes, among others, the use of a building or structure, or a portion thereof, for assembling, disassembling, fabricating, finishing, manufacturing, packaging, repair or processing operations that are not classified as a Group H hazardous or Group S storage occupancy.

3.6.2 Moderate-hazard factory industrial, Group F-1.
Factory industrial uses that are not classified as Factory Industrial F-2 Low Hazard shall be classified as F-1 Moderate Hazard and shall include, but not be limited to, the following:

- Aircraft (manufacturing, not to include repair)
- Appliances
- Athletic equipment
- Automobiles and other motor vehicles
- Bakeries
- Beverages: over 16-percent alcohol content
- Bicycles
- Boats
- Brooms or brushes
- Business machines
- Cameras and photo equipment
- Canvas or similar fabric
- Carpets and rugs (includes cleaning)
- Clothing
- Construction and agricultural machinery
- Disinfectants
- Dry cleaning and dyeing
- Electric generation plants
- Electronics
- Engines (including rebuilding)
- Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining facilities more than 232 m² (2,500 square feet) in area.
- Furniture
- Hemp products
Jute products
Laundries
Leather products
Machinery
Metals
Millwork (sash and door)
Motion pictures and television filming (without spectators)
Musical instruments
Optical goods
Paper mills or products
Photographic film
Plastic products
Printing or publishing
Recreational vehicles
Refuse incineration
Shoes
Soaps and detergents
Textiles
Tobacco
Trailers
Upholstering
Wood; distillation
Woodworking (cabinet)

3.6.3 Low-hazard factory industrial, Group F-2.

Factory industrial uses that involve the fabrication or manufacturing of noncombustible materials that during finishing, packing or processing do not involve a significant fire hazard shall be classified as F-2 occupancies and shall include, but not be limited to, the following:

- Beverages: up to and including 16-percent alcohol content
- Brick and masonry
- Ceramic products
- Foundries
- Glass products
- Gypsum
- Ice
- Metal products (fabrication and assembly)

3.7 HIGH-HAZARD GROUP H

3.7.1 High-hazard Group H.

High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in control areas complying with this Code based on the maximum allowable quantity limits for control areas set forth in

Tables 3.1.1(1) and 3.7.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this clause, the requirements of this Code and the Ghana Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the Ghana Fire Code.

For SI: 1 cubic foot = 0.028 m³, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NL = Not Limited; NA = Not Applicable; UD = Unclassified Detonable.

a. For use of control areas, see Clause 4.14.2.
b. The aggregate quantity in use and storage shall not exceed the quantity listed for storage.
c. The quantities of alcoholic beverages in retail and wholesale sales occupancies shall not be limited provided the liquids are packaged in individual containers not exceeding 1.3 gallons. In retail and wholesale sales occupancies, the quantities of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids with the remainder of the solutions not being flammable, shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons.
d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1. Where Note e also applies, the increase for both notes shall be applied accumulatively.
e. Maximum allowable quantities shall be increased 100 percent when stored in approved storage cabinets, day boxes, gas cabinets, gas rooms or exhausted enclosures or in listed safety cans in accordance with Clause 5003.9.10 of the Ghana Fire Code. Where Note d also applies, the increase for both notes shall be applied accumulatively.
f. Quantities shall not be limited in a building equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

g. Allowed only in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.
h. Containing not more than the maximum allowable quantity per control area of Class IA, IB or IC flammable liquids.
i. The maximum allowable quantity shall not apply to fuel oil storage complying with the Ghana Fire Code.
j. Quantities in parentheses indicate quantity units in parentheses at the head of each column.
k. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed when such materials are necessary for maintenance purposes, operation or sanitation of equipment when the storage containers and the manner of storage are approved.
l. Net weight of the pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks, including packaging, shall be used.
m. For gallons of liquids, divide the amount in pounds by 10 in accordance with the Ghana Fire Code.
n. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with this Code.
o. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.
p. The following shall not be included in determining the maximum allowable quantities:
   1. Liquid or gaseous fuel in fuel tanks on vehicles.
   2. Liquid or gaseous fuel in fuel tanks on motorized equipment operated in accordance with the Ghana Fire Code.
   3. Gaseous fuels in piping systems and fixed appliances regulated by this Code.
   4. Liquid fuels in piping systems and fixed appliances regulated by this Code.
   5. Alcohol-based hand rubs classified as Class I or II liquids in dispensers that are installed in accordance with the Ghana Fire Code. The location of the alcohol-based hand rub (ABHR) dispensers shall be provided in the construction documents.
q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with this Code.

- g. Allowed only where stored in approved exhausted gas cabinets or exhausted enclosures as specified in the Ghana Fire Code.
- h. Quantities in parentheses indicate quantity units in parentheses at the head of each column.
- i. For gallons of liquids, divide the amount in pounds by 10.
3.7.1.1 Uses other than Group H.
An occupancy that stores, uses or handles hazardous materials as described in one or more of the following items shall not be classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of the Ghana Fire Code.

2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the Ghana Fire Code.

3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment.

4. Cleaning establishments that utilize combustible liquid solvents having a flash point of 140°F (60°C) or higher in closed systems employing equipment listed by an approved testing agency, provided that this occupancy is separated from all other areas of the building by 1-hour fire barriers constructed in accordance with Clause 8.7 or 1-hour horizontal assemblies constructed in accordance with Clause 8.11, or both.

5. Cleaning establishments that utilize a liquid solvent having a flash point at or above 93°C (200°F).

7. Refrigeration systems.

8. The storage or utilization of materials for agricultural purposes on the premises.

9. Stationary storage battery systems installed in accordance with the Ghana Fire Code.

10. Corrosive personal or household products in their original packaging used in retail display.

11. Commonly used corrosive building materials.

12. Buildings and structures occupied for aerosol product storage shall be classified as Group S-1, provided that such buildings conform to the requirements of the Ghana Fire Code.

13. Display and storage of nonflammable solid and nonflammable or noncombustible liquid hazardous materials in quantities not exceeding the maximum allowable quantity per control area in Group M or S occupancies complying with this Code.

14. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the Ghana Fire Code.

15. Stationary fuel cell power systems installed in accordance with the Ghana Fire Code.

16. Capacitor energy storage systems in accordance with the Ghana Fire Code.

17. Group B higher education laboratory occupancies complying with this Code and the Ghana Fire Code.

3.7.2 Hazardous materials.
Hazardous materials in any quantity shall conform to the requirements of this Code, including Clause 4.14, and the Ghana Fire Code.

3.7.3 High-hazard Group H-1.
Buildings and structures containing materials that pose a detonation hazard shall be classified as Group H-1. Such materials shall include, but not be limited to, the following:

Detonable pyrophoric materials
Explosives:
Division 1.1
Division 1.2
Division 1.3
Division 1.4
Division 1.5
Division 1.6

Organic peroxides, unclassified detonable
Oxidizers, Class 4
Unstable (reactive) materials, Class 3 detonable and Class 4

3.7.3.1 Occupancies containing explosives not classified as H-1.
The following occupancies containing explosive materials shall be classified as follows:

1. Division 1.3 explosive materials that are used and maintained in a form where either confinement or configuration will not elevate the hazard from a mass fire to mass explosion hazard shall be allowed in H-2 occupancies.

2. Articles, including articles packaged for shipment, that are not regulated as a Division 1.4 explosive under Bureau of Alcohol, Tobacco, Firearms and Explosives regulations, or unpackaged articles used in process operations that do not propagate a detonation or deflagration between articles shall be allowed in H-3 occupancies.

3.7.4 High-hazard Group H-2.
Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning shall be classified as Group H-2. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or combustible liquids that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103.4 kPa).

Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with this Code.
Cryogenic fluids, flammable.
Flammable gases.
Organic peroxides, Class I.
Oxidizers, Class 3, that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103 kPa).

Pyrophoric liquids, solids and gases, non-detonable.
Unstable (reactive) materials, Class 3, non-detonable.
Water-reactive materials, Class 3.

3.7.5 High-hazard Group H-3.
Buildings and structures containing materials that readily support combustion or that pose a physical hazard shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or combustible liquids that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less.

Combustible fibers, other than densely packed baled cotton, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Clause 4.14.1.3.
Consumer fireworks, 1.4G (Class C, Common)
Cryogenic fluids, oxidizing
Flammable solids
Organic peroxides, Class II and III
Oxidizers, Class 2
Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less
Oxidizing gases
Unstable (reactive) materials, Class 2
Water-reactive materials, Class 2

3.7.6 High-hazard Group H-4.
Buildings and structures containing materials that are health hazards shall be classified as Group H-4. Such materials shall include, but not be limited to, the following:

Corrosives
Highly toxic materials
Toxic materials

3.7.7 High-hazard Group H-5.
Semiconductor fabrication facilities and comparable research and development areas in which hazardous production materials (HPM) are used and the aggregate quantity of materials is in excess of those listed in Tables 3.7.1(1) and 3.7.1(2) shall be classified as Group H-5. Such facilities and areas shall be designed and constructed in accordance with Clause 4.15.11.

3.7.8 Multiple hazards.
Buildings and structures containing a material or materials representing hazards that are
3.8 INSTITUTIONAL GROUP I

3.8.1 Institutional Group I.

Institutional Group I occupancy includes, among others, the use of a building or structure, or a portion thereof, in which care or supervision is provided to persons who are or are not capable of self-preservation without physical assistance or in which persons are detained for penal or correctional purposes or in which the liberty of the occupants is restricted. Institutional occupancies shall be classified as Group I-1, I-2, I-3 or I-4.

3.8.2 Institutional Group I-1.

Institutional Group I-1 occupancy shall include buildings, structures or portions thereof for more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised environment and receive custodial care. Buildings of Group I-1 shall be classified as one of the occupancy conditions specified in Clause 3.8.2.1 or 3.8.2.2. This group shall include, but not be limited to, the following:

- Alcohol and drug centers
- Assisted living facilities
- Congregate care facilities
- Group homes
- Halfway houses
- Residential board and care facilities
- Social rehabilitation facilities

3.8.2.1 Condition 1.

This occupancy condition shall include buildings in which all persons receiving custodial care who, without any assistance, are capable of responding to an emergency situation to complete building evacuation.

3.8.2.2 Condition 2.

This occupancy condition shall include buildings in which there are any persons receiving custodial care who require limited verbal or physical assistance while responding to an emergency situation to complete building evacuation.

3.8.2.3 Six to 16 persons receiving custodial care.

A facility housing not fewer than six and not more than 16 persons receiving custodial care shall be classified as Group R-4.

3.8.2.4 Five or fewer persons receiving custodial care.

A facility with five or fewer persons receiving custodial care shall be classified as Group R-3 or shall comply with the International Residential Code provided an automatic sprinkler system is installed in accordance with Clause 10.3.3.1.3.

3.8.3 Institutional Group I-2.

Institutional Group I-2 occupancy shall include buildings and structures used for medical care on a 24-hour basis for more than five persons who are incapable of self-preservation. This group shall include, but not be limited to, the following:

- Foster care facilities
- Detoxification facilities
- Hospitals
- Nursing homes
- Psychiatric hospitals

3.8.3.1 Occupancy conditions.

Buildings of Group I-2 shall be classified as one of the occupancy conditions specified in Clause 3.8.3.1.1 or 3.8.3.1.2.

3.8.3.1.1 Condition 1.

This occupancy condition shall include facilities that provide nursing and medical care but do not provide emergency care, surgery, obstetrics or in-patient stabilization units for psychiatric or detoxification, including but not limited to nursing homes and foster care facilities.

3.8.3.1.2 Condition 2.

This occupancy condition shall include facilities that provide nursing and medical care and could provide emergency care, surgery, obstetrics or in-patient stabilization units for psychiatric or detoxification, including but not limited to hospitals.

3.8.3.2 Five or fewer persons receiving medical care.

A facility with five or fewer persons receiving medical care shall be classified as Group R-3 or shall comply with the International Residential Code provided an automatic sprinkler system is installed in accordance with Clause 10.3.3.1.3.
3.8.4 Institutional Group I-3.

Institutional Group I-3 occupancy shall include buildings and structures that are inhabited by more than five persons who are under restraint or security. A Group I-3 facility is occupied by persons who are generally incapable of self-preservation due to security measures not under the occupants’ control. This group shall include, but not be limited to, the following:

- Correctional centers
- Detention centers
- Jails
- Prerlease centers
- Prisons
- Reformatories

Buildings of Group I-3 shall be classified as one of the occupancy conditions specified in Clauses 3.8.4.1 through 3.8.4.5 (see Clause 4.8.1).

3.8.4.1 Condition 1.

This occupancy condition shall include buildings in which free movement is allowed from sleeping areas, and other spaces where access or occupancy is permitted, to the exterior via means of escape without restraint. A Condition 1 facility is permitted to be constructed as Group R.

3.8.4.2 Condition 2.

This occupancy condition shall include buildings in which free movement is allowed from sleeping areas and any other occupied smoke compartment to one or more other smoke compartments. Escape to the exterior is impeded by locked exits.

3.8.4.3 Condition 3.

This occupancy condition shall include buildings in which free movement is allowed within individual smoke compartments such as within a residential unit comprised of individual sleeping units and group activity spaces, where escape is impeded by remote-controlled release of means of escape from such a smoke compartment to another smoke compartment.

3.8.4.4 Condition 4.

This occupancy condition shall include buildings in which free movement is restricted from an occupied space. Remote-controlled release is provided to permit movement from sleeping units, activity spaces and other occupied areas within the smoke compartment to other smoke compartments.

3.8.4.5 Condition 5.

This occupancy condition shall include buildings in which free movement is restricted from an occupied space. Staff-controlled manual release is provided to permit movement from sleeping units, activity spaces and other occupied areas within the smoke compartment to other smoke compartments.

3.8.5 Institutional Group I-4, day care facilities.

Institutional Group I-4 occupancy shall include buildings and structures occupied by more than five persons of any age who receive custodial care for fewer than 24 hours per day by persons other than parents or guardians, relatives by blood, marriage or adoption, and in a place other than the home of the person cared for. This group shall include, but not be limited to, the following:

- Adult day care
- Child day care

3.8.5.1 Classification as Group E.

A child day care facility that provides care for more than five but not more than 100 children 1, 2 years or less of age, where the rooms in which the children are cared for are located on a level of exit discharge serving such rooms and each of these child care rooms has an exit door directly to the exterior, shall be classified as Group E.

3.8.5.2 Within a place of religious worship.

Rooms and spaces within places of religious worship providing such care during religious functions shall be classified as part of the primary occupancy.

3.8.5.3 Five or fewer persons receiving care.

A facility having five or fewer persons receiving custodial care shall be classified as part of the primary occupancy.

3.8.5.4 Five or fewer persons receiving care in a dwelling unit.

A facility such as the above within a dwelling unit and having five or fewer persons receiving custodial care shall be classified as a Group R-3 occupancy or shall comply with this Code.
3.9 MERCANTILE GROUP M

3.9.1 Mercantile Group M.
Mercantile Group M occupancy includes, among others, the use of a building or structure or a portion thereof for the display and sale of merchandise, and involves stocks of goods, wares or merchandise incidental to such purposes and accessible to the public. Mercantile occupancies shall include, but not be limited to, the following:

- Department stores
- Drug stores
- Markets
- Greenhouses for display and sale of plants that provide public access.
- Motor fuel-dispensing facilities
- Retail or wholesale stores
- Sales rooms

3.9.2 Quantity of hazardous materials.
The aggregate quantity of nonflammable solid and nonflammable or noncombustible liquid hazardous materials stored or displayed in a single control area of a Group M occupancy shall not exceed the quantities in Table 4.14.2.5(1).

3.10 RESIDENTIAL GROUP R

3.10.1 Residential Group R.
Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I.

3.10.2 Residential Group R-1.
Residential Group R-1 occupancies containing sleeping units where the occupants are primarily transient in nature, including:

- Boarding houses (transient) with more than 10 occupants
- Congregate living facilities (transient) with more than 10 occupants
- Hotels (transient)
- Motels (transient)

3.10.3 Residential Group R-2.
Residential Group R-2 occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

- Apartment houses
- Congregate living facilities (nontransient) with more than 16 occupants
- Boarding houses (nontransient)
- Convents
- Dormitories
- Fraternities and sororities
- Monasteries
- Hotels (nontransient)
- Live/work units
- Motels (nontransient)
- Vacation timeshare properties

3.10.4 Residential Group R-3.
Residential Group R-3 occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

- Buildings that do not contain more than two dwelling units
- Care facilities that provide accommodations for five or fewer persons receiving care
- Congregate living facilities (nontransient) with 16 or fewer occupants
- Boarding houses (nontransient)
- Convents
- Dormitories
- Fraternities and sororities
- Monasteries
- Congregate living facilities (transient) with 10 or fewer occupants
- Boarding houses (transient)
- Lodging houses (transient) with five or fewer guest rooms and 10 or fewer occupants

3.10.4.1 Care facilities within a dwelling.
Care facilities for five or fewer persons receiving care that are within a single-family dwelling are permitted to comply with this Code provided an automatic sprinkler system is installed in accordance with Clause 10.3.3.1.3.

3.10.4.2 Lodging houses.
Owner-occupied lodging houses with five or fewer guest rooms and 10 or fewer total occupants shall be permitted to be constructed in accordance with this Code.

3.10.5 Residential Group R-4.
Residential Group R-4 occupancy shall include buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised residential environment and receive custodial care. Buildings of Group R-4 shall be classified as one of the occupancy conditions specified in Clause 3.10.5.1 or
3.10.5.2. This group shall include, but not be limited to, the following:

- Alcohol and drug centers
- Assisted living facilities
- Congregate care facilities
- Group homes
- Halfway houses
- Residential board and care facilities
- Social rehabilitation facilities

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this Code.

3.10.5.1 Condition 1.
This occupancy condition shall include buildings in which all persons receiving custodial care, without any assistance, are capable of responding to an emergency situation to complete building evacuation.

3.10.5.2 Condition 2.
This occupancy condition shall include buildings in which there are any persons receiving custodial care who require limited verbal or physical assistance while responding to an emergency situation to complete building evacuation.

3.11 STORAGE GROUP S

3.11.1 Storage Group S.
Storage Group S occupancy includes, among others, the use of a building or structure, or a portion thereof, for storage that is not classified as a hazardous occupancy.

3.11.1.1 Accessory storage spaces.
A room or space used for storage purposes that is accessory to another occupancy shall be classified as part of that occupancy.

3.11.2 Moderate-hazard storage, Group S-1.
Storage Group S-1 occupancies are buildings occupied for storage uses that are not classified as Group S-2, including, but not limited to, storage of the following:

- Aerosol products, Levels 2 and 3
- Aircraft hangar (storage and repair)
- Bags: cloth, burlap and paper
- Bamboos and rattan
- Baskets
- Belting: canvas and leather
- Books and paper in rolls or packs
- Boots and shoes
- Buttons, including cloth covered, pearl or bone
- Cardboard and cardboard boxes
- Clothing, woolen wearing apparel
- Cordage
- Dry boat storage (indoor)
- Furniture
- Furs
- Glues, mucilage, pastes and size
- Grains
- Horns and combs, other than celluloid
- Leather
- Linoleum
- Timber
- Motor vehicle repair garages complying with the maximum allowable quantities of hazardous materials listed in Table 3.7.1(1) (see Clause 4.6.8)
- Photo engravings
- Resilient flooring
- Self-service storage facility (mini-storage)
- Silks
- Soaps
- Sugar
- Tires, bulk storage of
- Tobacco, cigars, cigarettes and snuff
- Upholstery and mattresses
- Wax candles

3.11.3 Low-hazard storage, Group S-2.
Storage Group S-2 occupancies include, among others, buildings used for the storage of noncombustible materials such as products on wood pallets or in paper cartons with or without single thickness divisions; or in paper wrappings. Such products are permitted to have a negligible amount of plastic trim, such as knobs, handles or film wrapping. Group S-2 storage uses shall include, but not be limited to, storage of the following:

- Beverages up to and including 16-percent alcohol in metal, glass or ceramic containers
- Cement in bags
- Chalk and crayons
- Dairy products in nonwaxed coated paper containers
- Dry cell batteries
- Electrical coils
- Electrical motors
- Empty cans
- Food products
- Foods in noncombustible containers
- Fresh fruits and vegetables in nonplastic trays or containers
- Frozen foods
- Glass
Glass bottles, empty or filled with noncombustible liquids
Gypsum board
Inert pigments
Ivory
Meats
Metal cabinets
Metal desks with plastic tops and trim
Metal parts
Metals
Mirrors
Oil-filled and other types of distribution transformers
Parking garages, open or enclosed
Porcelain and pottery
Stoves
Talc and soapstones
Washers and dryers

3.12 UTILITY AND MISCELLANEOUS GROUP U

3.12.1 General.
Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this Code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings
Aircraft hangars, accessory to a one- or two-family residence (see Clause 4.12.4)
Barns
Carports
Communication equipment structures with a gross floor area of less than 139 m² (1,500 square feet)
Fences more than 1829 mm (6 feet) in height
Grain silos, accessory to a residential occupancy
Livestock shelters
Private garages
Retaining walls
Sheds
Stables
Tanks
Towers

3.12.1.1 Greenhouses.
Greenhouses not classified as another occupancy shall be classified as Use Group U.
PART 4: SPECIAL DETAILED REQUIREMENTS BASED ON OCCUPANCY AND USE

User note:

About this part: Part 4 provides detailed criteria for special uses and occupancies. The unique characteristics of a live/work unit as opposed to a 30-storey high-rise building call for specific standards for each. Twenty-seven clauses address covered and open mall buildings, atriums, hospitals, stages, buildings where hazardous materials are used and stored, jails and prisons, ambulatory care facilities and storm shelters, among other special occupancy issues.

4.1 SCOPE

4.1.1 Detailed occupancy and use requirements.
In addition to the occupancy and construction requirements in this Code, the provisions of this part apply to the occupancies and use described herein.

4.2 COVERED MALL AND OPEN MALL BUILDINGS

4.2.1 Applicability.
The provisions of this clause shall apply to buildings or structures defined herein as covered or open mall buildings not exceeding three floor levels at any point nor more than three stories above grade plane. Except as specifically required by this clause, covered and open mall buildings shall meet applicable provisions of this Code.

Exceptions:
1. Foyers and lobbies of Groups B, R-1 and R-2 are not required to comply with this clause.
2. Buildings need not comply with the provisions of this clause where they totally comply with other applicable provisions of this Code.

4.2.1.1 Open mall building perimeter line.
For the purpose of this Code, a perimeter line shall be established. The perimeter line shall encircle all buildings and structures that comprise the open mall building and shall encompass any open-air interior walkways, open-air courtyards or similar open-air spaces. The perimeter line shall define the extent of the open mall building. Anchor buildings and parking structures shall be outside of the perimeter line and are not considered as part of the open mall building.

4.2.2 Open space.
A covered mall building and attached anchor buildings and parking garages shall be surrounded on all sides by a permanent open space or not less than 18 288 mm (60 feet). An open mall building and anchor buildings and parking garages adjoining the perimeter line shall be surrounded on all sides by a permanent open space of not less than 18 288 mm (60 feet).

Exception: The permanent open space of 18 288 mm (60 feet) shall be permitted to be reduced to not less than 12 192 mm (40 feet), provided that the following requirements are met:
1. The reduced open space shall not be allowed for more than 75 percent of the perimeter of the covered or open mall building and anchor buildings.
2. The exterior wall facing the reduced open space shall have a fire-resistance rating of not less than 3 hours.
3. Openings in the exterior wall facing the reduced open space shall have opening protectives with a fire protection rating of not less than 3 hours.
4. Group E, H, I or R occupancies are not located within the covered or open mall building or anchor buildings.

4.2.3 Lease plan.
Each owner of a covered mall building or of an open mall building shall provide both the building and fire departments with a lease plan showing the location of each occupancy and its exits after the certificate of occupancy has been issued. Modifications or changes in occupancy or use from that shown on the lease plan shall not be made without prior approval of the building official.

4.2.4 Construction.
The construction of covered and open mall buildings, anchor buildings and parking
garages associated with a mall building shall comply with Clauses 4.2.4.1 through 4.2.4.3.

4.2.4.1 Area and types of construction.
The building area and type of construction of covered mall or open mall buildings, anchor buildings and parking garages shall comply with this clause.

4.2.4.1.1 Covered and open mall buildings.
The building area of any covered mall or open mall building shall not be limited provided that the covered mall or open mall building does not exceed three floor levels at any point nor three stories above grade plane, and is of Type I, II or III construction.

4.2.4.1.2 Anchor buildings.
The building area and building height of any anchor building shall be based on the type of construction as required by this Code.

Exception: The building area of any anchor building shall not be limited provided that the anchor building is not more than three stories above grade plane, and is of Type I, II or III construction.

4.2.4.1.3 Parking garage.
The building area and building height of any parking garage shall be based on the type of construction as required by Clauses 4.6.5 and 4.6.6, respectively.

4.2.4.2 Fire-resistance-rated separation.
Fire-resistance-rated separation is not required between tenant spaces and the mall. Fire-resistance-rated separation is not required between a food court and adjacent tenant spaces or the mall.

4.2.4.2.1 Tenant separations.
Each tenant space shall be separated from other tenant spaces by a fire partition complying with this Code.

4.2.4.2.2 Anchor building separation.
An anchor building shall be separated from the covered or open mall building by fire walls complying with this Code.

Exceptions:

1. Anchor buildings of not more than three stories above grade plane that have an occupancy classification the same as that permitted for tenants of the mall building shall be separated by 2-hour fire-resistance-rated fire barriers complying with this Code.

2. The exterior walls of anchor buildings separated from an open mall building by an open mall shall comply with Table 7.2

4.2.4.2.3 Parking garages.
An attached garage for the storage of passenger vehicles having a capacity of not more than nine persons and open parking garages shall be considered as a separate building where it is separated from the covered or open mall building or anchor building by not less than 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

Parking garages, which are separated from covered mall buildings, open mall buildings or anchor buildings, shall comply with the provisions of Table 7.2.

Pedestrian walkways and tunnels that connect garages to mall buildings or anchor buildings shall be constructed in accordance with Clause 32.4.

4.2.4.3 Open mall construction.

Floor assemblies in, and roof assemblies over, the open mall of an open mall building shall be open to the atmosphere for not less than 9096 mm (30 feet), measured perpendicular from the face of the tenant spaces on the lowest level, from edge of balcony to edge of balcony on upper floors and from edge of roof line to edge of roof line. The openings within, or the unroofed area of, an open mall shall extend from the lowest/grade level of the open mall through the entire roof assembly. Balconies on upper levels of the mall shall not project into the required width of the opening.
4.2.4.3.1 Pedestrian walkways.
Pedestrian walkways connecting balconies in an open mall shall be located not less than 9096 mm (20 feet) from any other pedestrian walkway.

4.2.5 Automatic sprinkler system.
Covered and open mall buildings and buildings connected shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, which shall comply with all of the following:

1. The automatic sprinkler system shall be complete and operative throughout occupied space in the mall building prior to occupancy of any of the tenant spaces. Unoccupied tenant spaces shall be similarly protected unless provided with approved alternative protection.

2. Sprinkler protection for the mall of a covered mall building shall be independent from that provided for tenant spaces or anchor buildings.

3. Sprinkler protection for the tenant spaces of an open mall building shall be independent from that provided for anchor buildings.

4. Sprinkler protection shall be provided beneath exterior circulation balconies located adjacent to an open mall.

5. Where tenant spaces are supplied by the same system, they shall be independently controlled.

Exception: An automatic sprinkler system shall not be required in spaces or areas of open parking garages separated from the covered or open mall building in accordance with Clause 4.2.4.2.3 and constructed in accordance with Clause 4.6.5.

4.2.6 Interior finishes and features.
Interior finishes within the mall and installations within the mall shall comply with Clauses 4.2.6.1 through 4.2.6.4.

4.2.6.1 Interior finish.
Interior wall and ceiling finishes within the mall of a covered mall building and within the exits of covered or open mall buildings shall have a minimum flame spread index and smoke-developed index of Class B in accordance with Part 9 Interior floor finishes shall meet the requirements of Clause 9.4.

4.2.6.2 Kiosks.
Kiosks and similar structures (temporary or permanent) located within the mall of a covered mall building or within the perimeter line of an open mall building shall meet the following requirements:

1. Combustible kiosks or other structures shall not be located within a covered or open mall unless constructed of any of the following materials:

   1.1. Fire-retardant-treated wood complying with this Code.

   1.2. Foam plastics having a maximum heat release rate not greater than 100 kW (105 Btu/h) when tested using the 20 kW ignition source shall meet the requirements of this Code.

   1.3. Aluminum composite material (ACM) meeting the requirements of Class A interior finish in accordance with Part 9 when tested as an assembly in the maximum thickness intended.

2. Kiosks or similar structures located within the mall shall be provided with approved automatic sprinkler system and detection devices.

3. The horizontal separation between kiosks or groupings thereof and other structures within the mall shall be not less than 6096 mm (20 feet).

4. Each kiosk or similar structure or groupings thereof shall have an area not greater than 28 m² (300 square feet).

4.2.6.3 Children’s play structures.
Children’s play structures located within the mall of a covered mall building or within the perimeter line of an open mall building shall comply with Clause 4.24. The horizontal
separation between children’s play structures, kiosks and similar structures within the mall shall be not less than 6096 mm (20 feet).

4.2.6.4 Plastic signs.
Plastic signs affixed to the storefront of any tenant space facing a mall or open mall shall be limited as specified in Clauses 4.2.6.4.1 through 4.2.6.4.5.

4.2.6.4.1 Area.
Plastic signs shall be not more than 20 percent of the wall area facing the mall.

4.2.6.4.2 Height and width.
Plastic signs shall be not greater than 914 mm (36 inches) in height, except that where the sign is vertical, the height shall be not greater than 2438 mm (96 inches) and the width shall be not greater than 914 mm (36 inches).

4.2.6.4.3 Location.
Plastic signs shall be located not less than 457 mm (18 inches) from adjacent tenants.

4.2.6.4.4 Plastics other than foam plastics.
Plastics other than foam plastics used in signs shall be light-transmitting plastics complying with this Code or shall have a self-ignition temperature of 343°C (650°F) or greater when tested in accordance with ASTM D1929, and a flame spread index not greater than 75 and smoke-developed index not greater than 450 when tested in the manner intended for use in accordance with ASTM E84 or meet the acceptance criteria of this Code when tested in accordance with ASTM-E84

4.2.6.4.4.1 Encasement.
Edges and backs of plastic signs in the mall shall be fully encased in metal.

4.2.6.4.5 Foam plastics.
Foam plastics used in signs shall have flame-retardant characteristics such that the sign has a maximum heat-release rate of 150 kilowatts when tested or when tested in accordance with ASTM-E84 using the 20 kW ignition source, and the foam plastics shall have the physical characteristics specified in this Code. Foam plastics used in signs installed in accordance with Clause 4.2.6.4 shall not be required to comply with the flame spread and smoke-developed indices specified in this Code.

4.2.6.4.5.1 Density.
The density of foam plastics used in signs shall be not less than 20 pounds per cubic foot (pcf) (320 kg/ m³).

4.2.6.4.5.2 Thickness.
The thickness of foam plastic signs shall not be greater than 12.7 mm (1/2 inch).

4.2.7 Emergency systems.
Covered and open mall buildings, anchor buildings and associated parking garages shall be provided with emergency systems complying with Clauses 4.2.7.1 through 4.2.7.5.

4.2.7.1 Fire hydrant system.
Covered and open mall buildings shall be equipped throughout with a Fire hydrant system as required by this Code.

4.2.7.2 Smoke control.
Where a covered mall building contains an atrium, a smoke control system shall be provided in accordance with Clause 4.4.5.

Exception: A smoke control system is not required in covered mall buildings where an atrium connects only two stories.

4.2.7.3 Emergency power.
Covered mall buildings greater than 4645 m² (50,000 square feet) in area and open mall buildings greater than 4645 m² (50,000 square feet) within the established perimeter line shall be provided with emergency power that is capable of operating the emergency voice/alarm communication system in accordance with this Code.

4.2.7.4 Emergency voice/alarm communication system.
Where the total floor area is greater than 4645 m² (50,000 square feet) within either a covered mall building or within the perimeter line of an open mall building, an emergency voice/alarm communication system shall be provided.

The fire department shall have access to any emergency voice/alarm communication systems serving a mall, required or otherwise. The systems shall be provided in accordance with this Code.
4.2.7.5 Fire department access to equipment.

Rooms or areas containing controls for air-conditioning systems, automatic fire-extinguishing systems, automatic sprinkler systems or other detection, suppression or control elements shall be identified for use by the fire department.

4.2.8 Means of escape.

Covered mall buildings, open mall buildings and each tenant space within a mall building shall be provided with means of escape as required by this clause and this Code. Where there is a conflict between the requirements of this Code and the requirements of Clauses 4.2.8.1 through 4.2.8.8, the requirements of Clauses 4.2.8.1 through 4.2.8.8 shall apply.

4.2.8.1 Mall width.
For the purpose of providing required escape, malls are permitted to be considered as corridors but need not comply with the requirements of this Code where the width of the mall is as specified in this clause.

4.2.8.1.1 Minimum width.
The aggregate clear escape width of the mall in either a covered or open mall building shall be not less than 6096 mm (20 feet). The mall width shall be sufficient to accommodate the occupant load served. Any portion of the minimum required aggregate escape width shall be not less than 3048 mm (10 feet) measured to a height of 2438 mm (8 feet) between any projection of a tenant space bordering the mall and the nearest kiosk, vending machine, bench, display opening, food court or other obstruction to means of escape travel.

4.2.8.2 Determination of occupant load.
The occupant load permitted in any individual tenant space in a covered or open mall building shall be determined as required by this Code. Means of escape requirements for individual tenant spaces shall be based on the occupant load thus determined.

4.2.8.2.1 Occupant formula.
In determining required means of escape of the mall, the number of occupants for whom means of escape are to be provided shall be based on gross leasable area of the covered or open mall building (excluding anchor buildings) and the occupant load factor as determined by Equation 4-1.

\[
OLF = (0.00007)(GLA) + 25
\]

Where:

- OLF = The occupant load factor (square feet per person)
- GLA = The gross leasable area (square feet).

Exception: Tenant spaces attached to a covered or open mall building but with a means of escape system that is totally independent of the open mall of an open mall building or of a covered mall building shall not be considered as gross leasable area for determining the required means of escape for the mall building.

4.2.8.2.2 OLF range.
The occupant load factor (OLF) is not required to be less than 30 and shall not exceed 50.

4.2.8.2.3 Anchor buildings.
The occupant load of anchor buildings opening into the mall shall not be included in computing the total number of occupants for the mall.

4.2.8.2.4 Food courts.
The occupant load of a food court shall be determined in accordance with this Code. For the purposes of determining the means of escape requirements for the mall, the food court occupant load shall be added to the occupant load of the covered or open mall building as calculated in Clause 4.2.8.2.1.

4.2.8.3 Number of means of escape.
Wherever the distance of travel to the mall from any location within a tenant space used by persons other than employees is greater than 22860 mm (75 feet) or the tenant space has an occupant load of 50 or more, not fewer than two means of escape shall be provided.

4.2.8.4 Arrangements of means of escape.
Assembly occupancies with an occupant load of 500 or more located within a covered mall building shall be so located such that their entrance will be immediately adjacent to a principal entrance to the mall and shall have not less than one-half of their required means of escape opening directly to the exterior of the covered mall building. Assembly occupancies
located within the perimeter line of an open mall building shall be permitted to have their main exit open to the open mall.

4.2.8.4.1 Anchor building means of escape.
Required means of escape for anchor buildings shall be provided independently from the mall means of escape system. The occupant load of anchor buildings opening into the mall shall not be included in determining means of escape requirements for the mall. The path of escape travel of malls shall not exit through anchor buildings. Malls terminating at an anchor building where other means of escape has not been provided shall be considered as a dead-end mall.

4.2.8.5 Distance to exits.
Within each individual tenant space in a covered or open mall building, the distance of travel from any point to an exit or entrance to the mall shall be not greater than 60 960 mm (200 feet).

The distance of travel from any point within a mall of a covered mall building to an exit shall be not greater than 60 960 mm (200 feet). The maximum distance of travel from any point within an open mall to the perimeter line of the open mall building shall be not greater than 60 960 mm (200 feet).

4.2.8.6 Access to exits.
Where more than one exit is required, they shall be so arranged that it is possible to travel in either direction from any point in a mall of a covered mall building to separate exits or from any point in an open mall of an open mall building to two separate locations on the perimeter line, provided that neither location is an exterior wall of an anchor building or parking garage. The width of an exit passageway or corridor from a mall shall be not less than 1676 mm (66 inches).

Exception: Access to exits is permitted by way of a dead-end mall that does not exceed a length equal to twice the width of the mall measured at the narrowest location within the dead-end portion of the mall.

4.2.8.6.1 Exit passageways.
Where exit passageways provide a secondary means of escape from a tenant space, the exit passageways shall be constructed in accordance with this Code.

4.2.8.7 Service areas facing on exit passageways.
Mechanical rooms, electrical rooms, building service areas and service elevators are permitted to open directly into exit passageways, provided that the exit passageway is separated from such rooms with not less than 1-hour fire barriers constructed in accordance with this Code or horizontal assemblies constructed in accordance with this Code. The fire protection rating of openings in the fire barriers shall be not less than 1 hour.

4.2.8.8 Security grilles and doors.
Horizontal sliding or vertical security grilles or doors that are a part of a required means of escape shall conform to the following:

1. Doors and grilles shall remain in the full open position during the period of occupancy by the general public.

2. Doors or grilles shall not be brought to the closed position when there are 10 or more persons occupying spaces served by a single exit or 50 or more persons occupying spaces served by more than one exit.

3. The doors or grilles shall be openable from within without the use of any special knowledge or effort where the space is occupied.

4. Where two or more exits are required, not more than one-half of the exits shall be permitted to include either a horizontal sliding or vertical rolling grille or door.

4.3 HIGH-RISE BUILDINGS

4.3.1 Applicability.
High-rise buildings shall comply with Clauses 4.3.2 through 4.3.6.

Exception: The provisions of Clauses 4.3.2 through 4.3.6 shall not apply to the following buildings and structures:

1. Airport traffic control towers in accordance with Clause 4.12.2.

2. Open parking garages in accordance with Clause 4.6.5.
3. The portion of a building containing a Group A-5 occupancy in accordance with Clause 3.3.6.

4. Special industrial occupancies in accordance with this Code

5. Buildings containing any one of the following:
   5.1. A Group H-1 occupancy.
   5.2. A Group H-2 occupancy in accordance with Clause 4.15.8.
   5.3. A Group H-3 occupancy in accordance with Clause 4.15.8.

4.3.2 Construction.
The construction of high-rise buildings shall comply with the provisions of Clauses 4.3.2.1 through 4.3.2.4.

4.3.2.1 Reduction in fire-resistance rating.
The fire-resistance rating reductions listed in Clauses 4.3.2.1.1 and 4.3.2.1.2 shall be allowed in buildings that have sprinkler control valves equipped with supervisory initiating devices and water-flow initiating devices for each floor.

4.3.2.1.1 Type of construction.
The following reductions in the minimum fire-resistance rating of the building elements in Table 601 shall be permitted as follows:

1. For buildings not greater than 128 m (420 feet) in building height, the fire-resistance rating of the building elements in Type IA construction shall be permitted to be reduced to the minimum fire-resistance ratings for the building elements in Type IB.

   Exception: The required fire-resistance rating of columns supporting floors shall not be reduced.

2. In other than Group F-1, H-2, H-3, H-5, M and S-1 occupancies, the fire-resistance rating of the building elements in Type IB construction shall be permitted to be reduced to the fire-resistance ratings in Type IA.

3. The building height and building area limitations of a building containing building elements with reduced fire-resistance ratings shall be permitted to be the same as the building without such reductions.

4.3.2.1.2 Shaft enclosures.
For buildings not greater than 128 m (420 feet) in building height, the required fire-resistance rating of the fire barriers enclosing vertical shafts, other than interior exit stairway and elevator hoistway enclosures, is permitted to be reduced to 1 hour where automatic sprinklers are installed within the shafts at the top and at alternate floor levels.

4.3.2.2 Seismic considerations.
For seismic considerations, see Part 17

4.3.2.3 Structural integrity of interior exit stairways and elevator hoistway enclosures.
For high-rise buildings of Risk Category III or IV in accordance with this Code and for all buildings that are more than 128 m (420 feet) in building height, enclosures for interior exit stairways and elevator hoistway enclosures shall comply with Clauses 4.3.2.3.1 through 4.3.2.3.4.

4.3.2.3.1 Wall assembly.
The wall assemblies making up the enclosures for interior exit stairways and elevator hoistway enclosures shall meet or exceed Soft Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.

4.3.2.3.2 Wall assembly materials.
The face of the wall assemblies making up the enclosures for interior exit stairways and elevator hoistway enclosures that are not exposed to the interior of the enclosures for interior exit stairways or elevator hoistway enclosure shall be constructed in accordance with one of the following methods:
1. The wall assembly shall incorporate not fewer than two layers of impact-resistant construction board each of which meets or exceeds Hard Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.

2. The wall assembly shall incorporate not less than one layer of impact-resistant construction material that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.

3. The wall assembly incorporates multiple layers of any material, tested in tandem that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.

4.3.2.3 Concrete and masonry walls. Concrete or masonry walls shall be deemed to satisfy the requirements of Clauses 4.3.2.3.1 and 4.3.2.3.2.

4.3.2.4 Other wall assemblies. Any other wall assembly that provides impact resistance equivalent to that required by Clauses 4.3.2.3.1 and 4.3.2.3.2 for Hard Body Impact Classification Level 3, as measured by the test method described in ASTM C1629/C1629M, shall be permitted.

4.3.2.4 Sprayed fire-resistant materials (SFRM). The bond strength of the SFRM installed throughout the building shall be in accordance with Table 4.3.2.4.

**TABLE 4.3.2.4: MINIMUM BOND STRENGTH**

<table>
<thead>
<tr>
<th>HEIGHT OF BUILDING</th>
<th>SFRM MINIMUM BOND STRENGTH</th>

</thead>
<tbody>
<tr>
<td>Up to 420 feet</td>
<td>430 psf</td>
</tr>
<tr>
<td>Greater than 420</td>
<td>1,000 psf</td>
</tr>
</tbody>
</table>

For SI: 1 foot = 304.8 mm, 1 pound per square foot (psf) = 0.0479 kW/m².

a. Above the lowest level of fire department vehicle access.

4.3.3 Automatic sprinkler system. Buildings and structures shall be equipped throughout with an automatic sprinkler system in accordance with this Code and a secondary water supply where required by Clause 4.3.3.3.

Exception: An automatic sprinkler system shall not be required in spaces or areas of:

1. Open parking garages in accordance with Clause 4.6.5.

2. Telecommunications equipment buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided that those spaces or areas are equipped throughout with an automatic fire detection system in accordance with Clause 10.7.2 and are separated from the remainder of the building by not less than 1-hour fire barriers constructed in accordance with this Code or not less than 2-hour horizontal assemblies constructed in accordance with this Code.

4.3.3.1 Number of sprinkler risers and system design. Each sprinkler system zone in buildings that are more than 128 m (420 feet) in building height shall be supplied by not fewer than two risers. Each riser shall supply sprinklers on alternate floors. If more than two risers are provided for a zone, sprinklers on adjacent floors shall not be supplied from the same riser.

4.3.3.1.1 Riser location. Sprinkler risers shall be placed in interior exit stairways and ramps that are remotely located in accordance with this Code.

4.3.3.2 Water supply to required fire pumps. In buildings that are more than 128 m (420 feet) in building height, required fire pumps shall be supplied by connections to not fewer than two water mains located in different streets.
Separate supply piping shall be provided between each connection to the water main and the pumps. Each connection and the supply piping between the connection and the pumps shall be sized to supply the flow and pressure required for the pumps to operate.

**Exception:** Two connections to the same main shall be permitted provided that the main is valved such that an interruption can be isolated so that the water supply will continue without interruption through not less than one of the connections.

### 4.3.3.3 Secondary water supply.

An automatic secondary on-site water supply having a capacity not less than the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings assigned to Seismic Design Category 2 or 3 as determined by this Code. An additional fire pump shall not be required for the secondary water supply unless needed to provide the minimum design intake pressure at the suction side of the fire pump supplying the automatic sprinkler system. The secondary water supply shall have a duration of not less than 30 minutes.

### 4.3.3.4 Fire pump room.

Fire pumps shall be located in rooms protected in accordance with this Code.

### 4.3.4 Emergency systems.

The detection, alarm and emergency systems of high-rise buildings shall comply with Clauses 4.3.4.1 through 4.3.4.8.

#### 4.3.4.1 Smoke detection.

Smoke detection shall be provided in accordance with this Code.

#### 4.3.4.2 Fire alarm system.

A fire alarm system shall be provided in accordance with this Code.

#### 4.3.4.3 Fire hydrant system.

A high-rise building shall be equipped with a Fire hydrant system as required by this Code.

#### 4.3.4.4 Emergency voice/alarm communication system.

An emergency voice/alarm communication system shall be provided in accordance with this Code.

#### 4.3.4.5 Emergency responder radio coverage.

Emergency responder radio coverage shall be provided in accordance with the Ghana Fire Code.

#### 4.3.4.6 Fire command.

A fire command center complying with this Code shall be provided in a location approved by the fire Code official.

#### 4.3.4.7 Smoke removal.

To facilitate smoke removal in post-fire salvage and overhaul operations, buildings and structures shall be equipped with natural or mechanical ventilation for removal of products of combustion in accordance with one of the following:

1. Easily identifiable, manually operable windows or panels shall be distributed around the perimeter of each floor at not more than 15 240 mm (50-foot) intervals. The area of operable windows or panels shall be not less than 3.7 m² (40 square feet) per 15 240 mm (50 linear feet) of perimeter.

**Exceptions:**

1. In Group R-1 occupancies, each sleeping unit or suite having an exterior wall shall be permitted to be provided with (0.19 m²) of venting area in lieu of the area specified in Item 1.

2. Windows shall be permitted to be fixed provided that glazing can be cleared by fire fighters.

2. Mechanical air-handling equipment providing one exhaust air change every 15 minutes for the area involved. Return and exhaust air shall be moved directly to the outside without recirculation to other portions of the building.

3. Any other approved design that will produce equivalent results.

#### 4.3.4.8 Standby and emergency power.

A standby power system complying with this Code shall be provided for the standby power loads specified in Clause 4.3.4.8.3. An emergency power system complying with this
78

Code shall be provided for the emergency power loads specified in Clause 4.3.4.8.4.

4.3.4.8.1 Equipment room.

If the standby or emergency power system includes a generator set inside a building, the system shall be located in a separate room enclosed with 2-hour fire barriers constructed in accordance with this Code or horizontal assemblies constructed in accordance with this Code, or both. System supervision with manual start and transfer features shall be provided at the fire command center.

Exception: In Group I-2, Condition 2, manual start and transfer features for the critical branch of the emergency power are not required to be provided at the fire command center.

4.3.4.8.2 Fuel line piping protection.

Fuel lines supplying a generator set inside a building shall be separated from areas of the building other than the room the generator is located in by an approved method or assembly that has a fire-resistance rating of not less than 2 hours. Where the building is protected throughout with an automatic sprinkler system installed in accordance with this Code the required fire-resistance rating shall be reduced to 1 hour.

4.3.4.8.3 Standby power loads.

The following are classified as standby power loads:

1. Ventilation and automatic fire detection equipment for smokeproof enclosures.
2. Elevators.
3. Where elevators are provided in a high-rise building for accessible means of escape, fire service access or occupant self-evacuation, the standby power system shall also comply with this Code, as applicable.

4.3.4.8.4 Emergency power loads.

The following are classified as emergency power loads:

1. Exit signs and means of escape illumination required by Part 11
2. Elevator car lighting.
3. Emergency voice/alarm communications systems.
4. Automatic fire detection systems.
5. Fire alarm systems.
6. Electrically powered fire pumps.
7. Power and lighting for the fire command center required by Clause 4.3.4.6.

4.3.5 Means of escape and evacuation.

The means of escape in high-rise buildings shall comply with Clauses 4.3.5.1 through 4.3.5.6.

4.3.5.1 Remoteness of interior exit stairways.

Required interior exit stairways shall be separated by a distance not less than 9144 mm (30 feet) or not less than one-fourth of the length of the maximum overall diagonal dimension of the building or area to be served, whichever is less. The distance shall be measured in a straight line between the nearest points of the enclosure surrounding the interior exit stairways. In buildings with three or more interior exit stairways, not fewer than two of the interior exit stairways shall comply with this clause. Interlocking or scissor stairways shall be counted as one interior exit stairway.

4.3.5.2 Additional interior exit stairway.

For buildings other than Group R-2 and their ancillary spaces that are more than 128 m (420 feet) in building height, one additional interior exit stairway meeting the requirements of this Code shall be provided in addition to the minimum number of exits required by this Code. The total capacity of any combination of remaining interior exit stairways with one interior exit stairway removed shall be not less than the total capacity required by this Code. Scissor stairways shall not be considered the additional interior exit stairway required by this clause.

Exceptions:
1. An additional interior exit stairway shall not be required to be installed in buildings having elevators used for occupant self-evacuation in accordance with this Code.

2. An additional interior exit stairway shall not be required for other portions of the building where the highest occupiable floor level in those areas is less than 128 m (420 feet) in building height.

4.3.5.3 Stairway door operation.
Stairway doors other than the exit discharge doors shall be permitted to be locked from the stairway side. Stairway doors that are locked from the stairway side shall be capable of being unlocked simultaneously without unlatching upon a signal from the fire command center.

4.3.5.3.1 Stairway communication system.
A telephone or other two-way communications system connected to an approved constantly attended station shall be provided at not less than every fifth floor in each stairway where the doors to the stairway are locked.

4.3.5.4 Smokeproof enclosures.
Every required interior exit stairway serving floors more than 22 860 mm (75 feet) above the lowest level of fire department vehicle access shall be a smokeproof enclosure in accordance with this Code.

4.3.5.5 Luminous escape path markings.
Luminous escape path markings shall be provided in accordance with this Code.

4.3.5.6 Emergency escape and rescue.
Emergency escape and rescue openings specified in this Code are not required.

4.3.6 Elevators.
Elevator installation and operation in high-rise buildings shall comply with Part 31 and Clauses 4.3.6.1 and 4.3.6.2.

4.3.6.1 Fire service access elevator.
In buildings with an occupied floor more than 36 576 mm (120 feet) above the lowest level of fire department vehicle access, not fewer than two fire service access elevators, or all elevators, whichever is less, shall be provided in accordance with this Code. Each fire service access elevator shall have a capacity of not less than 1588 kg (3,500 pounds) and shall comply with this Code.

4.3.6.2 Occupant evacuation elevators.
Where installed in accordance with this Code, passenger elevators for general public use shall be permitted to be used for occupant self-evacuation.

4.4 ATRIUMS

4.4.1 General.
In other than Group H occupancies, and where permitted by this Code the provisions of Clauses 4.4.1 through 4.4.10 shall apply to buildings or structures containing vertical openings defined as “Atriums.”

4.4.2 Use.
The floor of the atrium shall not be used for other than low fire hazard uses and only approved materials and decorations in accordance with the Ghana Fire Code shall be used in the atrium space.

Exception: The atrium floor area is permitted to be used for any approved use where the individual space is provided with an automatic sprinkler system in accordance with this Code.

4.4.3 Automatic sprinkler protection.
An approved automatic sprinkler system shall be installed throughout the entire building.

Exceptions:

1. That area of a building adjacent to or above the atrium need not be sprinklered provided that portion of the building is separated from the atrium portion by not less than 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with this Code.

2. Where the ceiling of the atrium is more than 16 764 mm (55 feet) above the floor, sprinkler protection at the ceiling of the atrium is not required.

4.4.4 Fire alarm system.
A fire alarm system shall be provided in accordance with this Code.
4.4.5 Smoke control.
A smoke control system shall be installed in accordance with this Code.

Exception: In other than Group I-2, and Group I-1, Condition 2, smoke control is not required for atriums that connect only two stories.

4.4.6 Enclosure of atriums.
Atrium spaces shall be separated from adjacent spaces by a 1-hour fire barrier constructed in accordance with this Code or a horizontal assembly constructed in accordance with this Code.

Exceptions:

1. A fire barrier is not required where a glass wall forming a smoke partition is provided. The glass wall shall comply with all of the following:

   1.1. Automatic sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the atrium side. The sprinklers shall be located between 102 mm and 305 mm (4 inches and 12 inches) away from the glass and at intervals along the glass not greater than 1829 mm (6 feet). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction;

   1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and

   1.3. Where glass doors are provided in the glass wall, they shall be either self-closing or automatic-closing.

2. A fire barrier is not required where a glass-block wall assembly complying with this Code and having a 3/4-hour fire protection rating is provided.

3. A fire barrier is not required between the atrium and the adjoining spaces of up to three floors of the atrium provided that such spaces are accounted for in the design of the smoke control system.

4. A fire barrier is not required between the atrium and the adjoining spaces where the atrium is not required to be provided with a smoke control system.

4.4.7 Standby power.
Equipment required to provide smoke control shall be provided with standby power in accordance with this Code.

4.4.8 Interior finish.
The interior finish of walls and ceilings of the atrium shall be not less than Class B. Sprinkler protection shall not result in a reduction in class.

4.4.9 Exit access travel distance.
Exit access travel distance for areas open to an atrium shall comply with the requirements of this clause.

4.4.9.1 Escape not through the atrium.
Where required access to the exits is not through the atrium, exit access travel distance shall comply with this Code.

4.4.9.2 Exit access travel distance at the level of exit discharge.
Where the path of escape travel is through an atrium space, exit access travel distance at the level of exit discharge shall be determined in accordance with this Code.

4.4.9.3 Exit access travel distance at other than the level of exit discharge.
Where the path of escape travel is not at the level of exit discharge from the atrium, that portion of the total permitted exit access travel distance that occurs within the atrium shall be not greater than 60 960 mm (200 feet).

4.4.10 Interior exit stairways.
Not greater than 50 percent of interior exit stairways are permitted to escape through an...
atrium on the level of exit discharge in accordance with this Code.

4.5 UNDERGROUND BUILDINGS

4.5.1 General.
The provisions of Clauses 4.5.2 through 4.5.9 apply to building spaces having a floor level used for human occupancy more than 9144 mm (30 feet) below the finished floor of the lowest level of exit discharge.

Exceptions: The provisions of Clause 4.5 are not applicable to the following buildings or portions of buildings:

1. One- and two-family dwellings, sprinklered in accordance with this Code
2. Parking garages provided with automatic sprinkler systems in compliance with Clause 4.5.3.
3. Fixed guideway transit systems.
4. Grandstands, bleachers, stadiums, arenas and similar facilities.
5. Where the lowest storey is the only storey that would qualify the building as an underground building and has an area not greater than 139 m$^2$ (1,500 square feet) and has an occupant load less than 10.
6. Pumping stations and other similar mechanical spaces intended only for limited periodic use by service or maintenance personnel.

4.5.2 Construction requirements.
The underground portion of the building shall be of Type I construction.

4.5.3 Automatic sprinkler system.
The highest level of exit discharge serving the underground portions of the building and all levels below shall be equipped with an automatic sprinkler system installed in accordance with this Code Water-flow switches and control valves shall be supervised in accordance with this Code.

4.5.4 Compartmentation.
Compartmentation shall be in accordance with Clauses 4.5.4.1 through 4.5.4.3.

4.5.4.1 Number of compartments.
A building having a floor level more than 18 288 mm (60 feet) below the finished floor of the lowest level of exit discharge shall be divided into not fewer than two compartments of approximately equal size. Such compartmentation shall extend through the highest level of exit discharge serving the underground portions of the building and all levels below.

Exception: The lowest storey need not be compartmented where the area is not greater than 139 m$^2$ (1,500 square feet) and has an occupant load of less than 10.

4.5.4.2 Smoke barrier penetration.
The compartments shall be separated from each other by a smoke barrier in accordance with Clause 709. Penetrations between the two compartments shall be limited to plumbing and electrical piping and conduit that are firestopped in accordance with this Code. Doorways shall be protected by fire door assemblies that comply with this Code automatic-closing by smoke detection in accordance with this Code and installed in accordance with this Code. Where provided, each compartment shall have an air supply and an exhaust system independent of the other compartments.

4.5.4.3 Elevators.
Where elevators are provided, each compartment shall have direct access to an elevator. Where an elevator serves more than one compartment, an enclosed elevator lobby shall be provided and shall be separated from each compartment by a smoke barrier in accordance with this Code. Doorways in the smoke barrier shall be protected by fire door assemblies that comply with this Code.

4.5.5 Smoke control system.
A smoke control system shall be provided in accordance with Clauses 4.5.5.1 and 4.5.5.2.

4.5.5.1 Control system.
A smoke control system is required to control the migration of products of combustion in accordance with this Code and the provisions of this clause. Smoke control shall restrict
movement of smoke to the general area of fire origin and maintain means of escape in a usable condition.

4.5.5.2 Compartment smoke control system. Where compartmentation is required, each compartment shall have an independent smoke control system. The system shall be automatically activated and capable of manual operation in accordance with this Code

4.5.6 Fire alarm systems. A fire alarm system shall be provided where required by this Code.

4.5.7 Means of escape. Means of escape shall be in accordance with this Code.

4.5.7.1 Number of exits. Each floor level shall be provided with no fewer than two exits. Where compartmentation is required by Clause 4.5.4, each compartment shall have not fewer than one exit and not less than one exit access doorway into the adjoining compartment.

4.5.7.2 Smokeproof enclosure. Every required stairway serving floor levels more than 9144 mm (30 feet) below the finished floor of its level of exit discharge shall comply with the requirements for a smokeproof enclosure as provided in this Code.

4.5.8 Standby and emergency power. A standby power system complying with this Code shall be provided for the standby power loads specified in Clause 4.5.8.1. An emergency power system complying with this Code shall be provided for the emergency power loads specified in Clause 4.5.8.2.

4.5.8.1 Standby power loads. The following are classified as standby power loads:

   1. Smoke control system.
   2. Ventilation and automatic fire detection equipment for smokeproof enclosures.
   3. Elevators, as required in this Code

4.5.8.2 Emergency power loads. The following are classified as emergency power loads:

   1. Emergency voice/alarm communications systems.
   2. Fire alarm systems.
   3. Automatic fire detection systems.
   4. Elevator car lighting.
   5. Means of escape and exit sign illumination as required by Part 11.
   6. Fire pumps.

4.5.9 Fire hydrant system. The underground building shall be equipped throughout with a Fire hydrant system in accordance with this Code.

4.6 MOTOR-VEHICLE-RELATED OCCUPANCIES

4.6.1 General. All motor-vehicle-related occupancies shall comply with Clause 4.6.2. Private garages and carports shall also comply with Clause 4.6.3. Open public parking garages shall also comply with Clauses 4.6.4 and 4.6.5. Enclosed public parking garages shall also comply with Clauses 4.6.4 and 4.6.6. Motor fuel-dispensing facilities shall also comply with Clause 4.6.7. Repair garages shall also comply with Clause 4.6.8.

4.6.2 Design. Private garages and carports, open and enclosed public parking garages, motor fuel-dispensing facilities and repair garages shall comply with Clauses 4.6.2.1 through 4.6.2.8.

4.6.2.1 Automatic garage door openers and vehicular gates. Automatic garage door openers shall be listed and labeled in accordance with this Code. Where provided, automatic vehicular gates shall comply with this Code.

4.6.2.2 Clear height. The clear height of each floor level in vehicle and pedestrian traffic areas shall be not less than 2134 mm (7 feet). Canopies under which fuels are dispensed shall have a clear height in accordance with Clause 4.6.7.2.

   Exception: A lower clear height is permitted for a parking tier in mechanical-access open parking garages where approved by the building official.

4.6.2.3 Accessible parking spaces. Where parking is provided, accessible parking spaces, access aisles and vehicular routes
serving accessible parking shall be provided in accordance with this Code.

4.6.2.4 Floor surfaces.

Floor surfaces shall be of concrete or similar approved noncombustible and nonabsorbent materials. The area of floor used for the parking of automobiles or other vehicles shall be sloped to facilitate the movement of liquids to a drain or toward the main vehicle entry doorway. The surface of vehicle fueling pads in motor fuel-dispensing facilities shall be in accordance with Clause 4.6.7.1.

Exceptions:

1. Asphalt parking surfaces shall be permitted at ground level for public parking garages and private carports.

2. Floors of Group S-2 parking garages shall not be required to have a sloped surface.

3. Slip-resistant, nonabsorbent, interior floor finishes having a critical radiant flux not more than 0.45 W/cm², as determined by ASTM E648 shall be permitted in repair garages.

4.6.2.5 Sleeping rooms.

Openings between a motor vehicle-related occupancy and a room used for sleeping purposes shall not be permitted.

4.6.2.6 Fuel dispensing.

The dispensing of fuel shall only be permitted in motor fuel-dispensing facilities in accordance with Clause 4.6.7.

4.6.2.7 Mixed occupancies and uses.

Mixed uses shall be allowed in the same building as public parking garages and repair garages in accordance with Clause 6.11.1. Mixed uses in the same building as an open parking garage are subject to Clauses 4.2.4.2.3, 4.6.5.11, 6.11.1, 6.13.3, 6.13.4 and 6.13.7.

4.6.2.8 Equipment and appliances.

Equipment and appliances shall be installed in accordance with Clauses 4.6.2.8.1 through 4.6.2.8.3.

4.6.2.8.1 Elevation of ignition sources.

Equipment and appliances having an ignition source and located in hazardous locations and public garages, private garages, repair garages, automotive motor fuel-dispensing facilities and parking garages shall be elevated such that the source of ignition is not less than 457 mm (18 inches) above the floor surface on which the equipment or appliance rests. For the purpose of this clause, rooms or spaces that are not part of the living space of a dwelling unit and that communicate directly with a private garage through openings shall be considered to be part of the private garage.

Exception: Elevation of the ignition source is not required for appliances that are listed as flammable vapour ignition resistant.

4.6.2.8.1.1 Parking garages.

Connection of a parking garage with any room in which there is a fuel-fired appliance shall be by means of a vestibule providing a two-doorway separation, except that a single door is permitted where the sources of ignition in the appliance are elevated in accordance with Clause 4.6.2.8.

Exception: This clause shall not apply to appliance installations complying with Clause 4.6.2.8.2 or 4.6.2.8.3.

4.6.2.8.2 Public garages.

Appliances located in public garages, motor fuel-dispensing facilities, repair garages or other areas frequented by motor vehicles shall be installed not less than 2438 mm (8 feet) above the floor. Where motor vehicles are capable of passing under an appliance, the appliance shall be installed at the clearances required by the appliance manufacturer and not less than 305 mm (1 foot) higher than the tallest vehicle garage door opening.

Exception: The requirements of this clause shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Clause 4.6.2.8.1.

4.6.2.8.3 Private garages.

Appliances located in private garages and

4.6.3 Private garages and carports.

Private garages and carports shall comply with Clauses 4.6.2 and 4.6.3, or they shall comply with Clauses 4.6.2 and 4.6.4.

4.6.3.1 Classification.

Private garages and carports shall be classified as Group U occupancies. Each private garage shall be not greater than $93 \text{ m}^2$ (1,000 square feet) in area. Multiple private garages are permitted in a building where each private garage is separated from the other private garages by 1-hour fire barriers in accordance with this Code or 1-hour horizontal assemblies in accordance with this Code.

4.6.3.2 Separation.

For other than private garages adjacent to dwelling units, the separation of private garages from other occupancies shall comply with Clause 6.11. Separation of private garages from dwelling units shall comply with Clauses 4.6.3.2.1 and 4.6.3.2.2.

4.6.3.2.2 Ducts.

Ducts in a private garage and ducts penetrating the walls or ceilings separating the dwelling unit from the garage, including its attic area, shall be constructed of sheet steel of not less than 0.48 mm (0.019 inch) in thickness and shall not have openings into the garage.

4.6.3.3 Carports.

Carports shall be open on not fewer than two sides. Carports open on fewer than two sides shall be considered to be a garage and shall comply with the requirements for private garages.

4.6.3.3.1 Carport separation.

A separation is not required between a Group R-3 and U carport, provided that the carport is entirely open on two or more sides and there are not enclosed areas above.

4.6.4 Public parking garages.

Parking garages, other than private garages, shall be classified as public parking garages and shall comply with the provisions of Clauses 4.6.2 and 4.6.4 and shall be classified as either an open parking garage or an enclosed parking garage. Open parking garages shall also comply with Clause 4.6.5. Enclosed parking garages shall also comply with Clause 4.6.6.

4.6.4.1 Guards.

Guards shall be provided in accordance with this Code. Guards serving as vehicle barriers shall comply with Clauses 4.6.4.2 and Clause 11.15.

4.6.4.2 Vehicle barriers.

Vehicle barriers not less than 835 mm (2 feet 9 inches) in height shall be placed where the vertical distance from the floor of a drive lane or parking space to the ground or surface directly below is greater than 305 mm (1 foot). Vehicle barriers shall comply with the loading requirements of this Code.

Exception: Vehicle barriers are not required in vehicle storage compartments in a mechanical access parking garage.

4.6.4.3 Ramps.

Vehicle ramps shall not be considered as required exits unless pedestrian facilities are provided. Vehicle ramps that are utilized for vertical circulation as well as for parking shall not exceed a slope of 1:15 (6.67 percent).

4.6.5 Open parking garages.

Open parking garages shall comply with Clauses 4.6.2, 4.6.4 and 4.6.5.

4.6.5.1 Construction.

Open parking garages shall be of Type I or III construction. Open parking garages shall meet the design requirements of Part 17. For vehicle barriers, see Clause 4.6.4.2.

4.6.5.2 Openings.

For natural ventilation purposes, the exterior side of the structure shall have uniformly distributed openings on two or more sides. The area of such openings in exterior walls on a tier shall be not less than 20 percent of the total perimeter wall area of each tier. The aggregate length of the openings considered to be providing natural ventilation shall be not less than 40 percent of the perimeter of the tier.
Interior walls shall be not less than 20 percent open with uniformly distributed openings.

**Exception:** Openings are not required to be distributed over 40 percent of the building perimeter where the required openings are uniformly distributed over two opposing sides of the building.

### 4.6.5.2.1 Openings below grade.

Where openings below grade provide required natural ventilation, the outside horizontal clear space shall be one and one-half times the depth of the opening. The width of the horizontal clear space shall be maintained from grade down to the bottom of the lowest required opening.

### 4.6.5.3 Mixed occupancies and uses.

Mixed uses shall be allowed in the same building as an open parking garage subject to the provisions of Clauses 4.2.4.2.3, 4.6.5.11, 6.11.1, 6.13.3, 6.13.4 and 6.13.7.

### 4.6.5.4 Area and height.

Area and height of open parking garages shall be limited as set forth in Part 6 for Group S-2 occupancies and as further provided for in Clause 6.11.1.

#### TABLE 4.6.5.4

<td>50,000</td>
<td>4 tiers</td>
</tr>
</tbody>
</table>

For SI: 1 square foot = 0.0929 m².

### 4.6.5.4.1 Single use.

Where the open parking garage is used exclusively for the parking or storage of private motor vehicles, and the building is without other uses, the area and height shall be permitted to comply with Table 4.6.5.4, along with increases allowed by Clause 4.6.5.5.

**Exception:** The grade-level tier is permitted to contain an office, waiting and toilet rooms having a total combined area of not more than 93 m² (1,000 square feet). Such area need not be separated from the open parking garage.

In open parking garages having a spiral or sloping floor, the horizontal projection of the structure at any cross clause shall not exceed the allowable area per parking tier. In the case of an open parking garage having a continuous spiral floor, each 2896 mm (9 feet 6 inches) of height, or portion thereof, shall be considered under these provisions to be a tier.

### 4.6.5.5 Area and height increases.

The allowable area and height of open parking garages shall be increased in accordance with the provisions of this clause. Garages with sides open on three-fourths of the building’s perimeter are permitted to be increased by 25 percent in area and one tier in height. Garages with sides open around the entire building’s perimeter are permitted to be increased by 50 percent in area and one tier in height. For a side to be considered open under these provisions, the total area of openings along the side shall be not less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier. For purposes of calculating the interior area of the side, the height shall not exceed 2134 mm (7 feet).

Allowable tier areas in Table 4.6.5.4 shall be increased for open parking garages constructed to heights less than the table maximum. The gross tier area of the garage shall not exceed that permitted for the higher
structure. Not fewer than three sides of each such larger tier shall have continuous horizontal openings not less than 762 mm (30 inches) in clear height extending for not less than 80 percent of the length of the sides. All parts of such larger tier shall be not more than 60 960 mm (200 feet) horizontally from such an opening. In addition, each such opening shall face a street or yard accessible to a street with a width of not less than 9144 mm (30 feet) for the full length of the opening, and standpipes shall be provided in each such tier.

Open parking garages of Type I construction, with all sides open, shall be unlimited in allowable area where the building height does not exceed 22 860 mm (75 feet). For a side to be considered open, the total area of openings along the side shall be not less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier. For purposes of calculating the interior area of the side, the height shall not exceed 2134 mm (7 feet). All portions of tiers shall be within 60 960 mm (200 feet) horizontally from such openings or other natural ventilation openings as defined in Clause 4.6.5.2. These openings shall be permitted to be provided in courts with a minimum dimension of 6096 mm (20 feet) for the full width of the openings.

4.6.5.6 Fire separation distance.

Exterior walls and openings in exterior walls shall comply with Tables 7.1 and 7.2. The distance to an adjacent plot line shall be determined in accordance with Table 7.2 and Clause 8.5.

4.6.5.7 Means of escape.

Where persons other than parking attendants are permitted, open parking garages shall meet the means of escape requirements of Part 11. Where persons other than parking attendants are not permitted, there shall be not fewer than two exit stairways. Each exit stairway shall be not less than 914 mm (36 inches) in width. Lifts shall be permitted to be installed for use of employees only, provided that they are completely enclosed by noncombustible materials.

4.6.5.8 Fire hydrant system.

An open parking garage shall be equipped with a Fire hydrant system as required by Clause 10.5.3.

4.6.5.9 Enclosure of vertical openings.

Enclosure shall not be required for vertical openings except as specified in Clause 4.6.5.7.

4.6.5.10 Ventilation.

Ventilation, other than the percentage of openings specified in Clause 4.6.5.2, shall not be required.

4.6.5.11 Prohibitions.

The following uses and alterations are not permitted:

1. Vehicle repair work.
2. Parking of buses, trucks and similar vehicles.
3. Partial or complete closing of required openings in exterior walls by tarpaulins or any other means.
4. Dispensing of fuel.

4.6.6 Enclosed parking garages.

Enclosed parking garages shall comply with Clauses 4.6.2, 4.6.4 and 4.6.6.

4.6.6.1 Heights and areas.

Enclosed vehicle parking garages and portions thereof that do not meet the definition of open parking garages shall be limited to the allowable heights and areas specified in Clause 6.4 and 6.9 as modified by Clause 6.10. Roof parking is permitted.

4.6.6.2 Ventilation.

A mechanical ventilation system and exhaust system shall be provided in accordance with this Code.

Exception: Mechanical ventilation shall not be required for enclosed parking garages that are accessory to one- and two-family dwellings.

4.6.6.3 Automatic sprinkler system.

An enclosed parking garage shall be equipped with an automatic sprinkler system in accordance with Clause 10.3.2.10.

4.6.7 Motor fuel-dispensing facilities.

Motor fuel-dispensing facilities shall comply with the Ghana Fire Code and Clauses 4.6.2 and 4.6.7.
4.6.7.2 Canopies.

Canopies under which fuels are dispensed shall have a clear, unobstructed height of not less than 4115 mm (13 feet 6 inches) to the lowest projecting element in the vehicle drive-through area. Canopies and their supports over pumps shall be of noncombustible materials, fire-retardant-treated wood complying with Part 24, heavy timber complying with this Code or construction providing 1-hour fire resistance. Combustible materials used in or on a canopy shall comply with one of the following:

1. Shielded from the pumps by a noncombustible element of the canopy, or heavy timber complying with Clause 24.4.11.

2. Plastics covered by aluminum facing having a thickness of not less than 0.30 mm (0.010 inch) or corrosion-resistant steel having a base metal thickness of not less than 0.41 mm (0.016 inch). The plastic shall have a flame spread index of 25 or less and a smoke-developed index of 450 or less when tested in the form intended for use in accordance with ASTM E84 and a self-ignition temperature of 343°C (650°F) or greater when tested in accordance with ASTM D1929.

3. Panels constructed of light-transmitting plastic materials shall be permitted to be installed in canopies erected over motor vehicle fuel-dispensing station fuel dispensers, provided that the panels are located not less than 3048 mm (10 feet) from any building on the same plot and face yards or streets not less than 12192 mm (40 feet) in width on the other sides. The aggregate areas of plastics shall be not greater than 93 m² (100 square feet).

4.6.7.2.1 Canopies used to support gaseous hydrogen systems.

Canopies that are used to shelter dispensing operations where flammable compressed gases are located on the roof of the canopy shall be in accordance with the following:

1. The canopy shall meet or exceed Type I construction requirements.

2. Operations located under canopies shall be limited to refueling only.

3. The canopy shall be constructed in a manner that prevents the accumulation of hydrogen gas.

4.6.8 Repair garages.

Repair garages shall be constructed in accordance with the Ghana Fire Code and Clauses 4.6.2 and 4.6.8. This occupancy shall not include motor fuel-dispensing facilities, as regulated in Clause 4.6.7.

4.6.8.1 Ventilation.

Repair garages shall be mechanically ventilated in accordance with the International Mechanical Code. The ventilation system shall be controlled at the entrance to the garage.

4.6.8.2 Gas detection system.

Repair garages used for repair of vehicles fueled by nonodorized gases including but not limited to hydrogen and nonodorized LNG, shall be provided with a gas detection system that complies with Clause 10.16. The gas detection system shall be designed to detect leakage of nonodorized gaseous fuel. Where lubrication or chassis service pits are provided in garages used for repairing nonodorized LNG-fueled vehicles, gas sensors shall be provided in such pits.

4.6.8.2.1 System activation.

Activation of a gas detection alarm shall result in all of the following:

1. Initiation of distinct audible and visual alarm signals in the repair garage, where the ventilation system is interlocked with gas detection.

2. Deactivation of all heating systems located in the repair garage.

3. Activation of the mechanical ventilation system, where the
4.6.8.2.2 Failure of the gas detection system.
Failure of the gas detection system shall automatically deactivate the heating system, activate the mechanical ventilation system where the system is interlocked with the gas detection system, and cause a trouble signal to sound at an approved location.

4.6.8.3 Automatic sprinkler system.
A repair garage shall be equipped with an automatic sprinkler system in accordance with this Code.

4.7 GROUP I-2

4.7.1 General.
Occupancies in Group I-2 shall comply with the provisions of Clauses 4.7.1 through 4.7.11 and other applicable provisions of this Code.

4.7.2 Corridors continuity and separation.
Corridors in occupancies in Group I-2 shall be continuous to the exits and shall be separated from other areas in accordance with Clause 4.7.3 except spaces conforming to Clauses 4.7.2.1 through 4.7.2.6.

4.7.2.1 Waiting and similar areas.
Waiting areas, public-use areas or group meeting spaces constructed as required for corridors shall be permitted to be open to a corridor, only where all of the following criteria are met:

1. The spaces are not occupied as care recipient’s sleeping rooms, treatment rooms, incidental uses in accordance with Clause 6.12, or hazardous uses.
2. The open space is protected by an automatic fire detection system installed in accordance with Clause 10.7.
3. The corridors onto which the spaces open, in the same smoke compartment, are protected by an automatic fire detection system installed in accordance with Clause 907, or the smoke compartment in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with this Code.
4. The space is arranged so as not to obstruct access to the required exits.

4.7.2.2 Care providers’ stations.
Spaces for care providers’, supervisory staff, doctors’ and nurses’ charting, communications and related clerical areas shall be permitted to be open to the corridor, where such spaces are constructed as required for corridors.

4.7.2.3 Psychiatric treatment areas.
Areas wherein psychiatric care recipients who are not capable of self-preservation are housed, or group meeting or multipurpose therapeutic spaces other than incidental uses in accordance with Clause 6.12, under continuous supervision by facility staff, shall be permitted to be open to the corridor, where the following criteria are met:

1. Each area does not exceed 140 m² (1,500 square feet).
2. The area is located to permit supervision by the facility staff.
3. The area is arranged so as not to obstruct any access to the required exits.
4. The area is equipped with an automatic fire detection system installed in accordance with this Code.
5. Not more than one such space is permitted in any one smoke compartment.
6. The walls and ceilings of the space are constructed as required for corridors.

4.7.2.4 Gift shops.
Gift shops and associated storage that are less than 455 m² (500 square feet) in area shall be permitted to be open to the corridor where such spaces are constructed as required for corridors.
4.7.2.5 Nursing home housing units.

In Group I-2, Condition 1 occupancies, in areas where nursing home residents are housed, shared living spaces, group meeting or multipurpose therapeutic spaces shall be permitted to be open to the corridor, where all of the following criteria are met:

1. The walls and ceilings of the space are constructed as required for corridors.
2. The spaces are not occupied as resident sleeping rooms, treatment rooms, incidental uses in accordance with this Code or hazardous uses.
3. The open space is protected by an automatic fire detection system installed in accordance with this Code.
4. The corridors onto which the spaces open, in the same smoke compartment, are protected by an automatic fire detection system installed in accordance with this Code or the smoke compartment in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with this Code.
5. The space is arranged so as not to obstruct access to the required exits.

4.7.2.6 Nursing home cooking facilities.

In Group I-2, Condition 1 occupancies, rooms or spaces that contain a cooking facility with domestic cooking appliances shall be permitted to be open to the corridor where all of the following criteria are met:

1. The number of care recipients housed in the smoke compartment shall not be greater than 30.
2. The number of care recipients served by the cooking facility shall not be greater than 30.
3. Not more than one cooking facility area shall be permitted in a smoke compartment.
4. The types of domestic cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.
5. The corridor shall be a clearly identified space delineated by construction or floor pattern, material or color.
6. The space containing the domestic cooking facility shall be arranged so as not to obstruct access to the required exit.
7. Domestic cooking hoods installed and constructed in accordance with this Code shall be provided over cooktops and ranges.
8. Cooktops and ranges shall be protected in accordance with Clause 10.4.13.
9. A shut-off for the fuel and electrical power supply to the cooking equipment shall be provided in a location that is accessible only to staff.
10. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.
11. A portable fire extinguisher shall be provided. Installation shall be in accordance with Clause 10.6, and the extinguisher shall be located within a 9144 mm (30-foot) distance of travel from each domestic cooking appliance.

4.7.3 Corridor wall construction.

Corridor walls shall be constructed as smoke partitions in accordance with this Code.

4.7.3.1 Corridor doors.

Corridor doors, other than those in a wall required to be rated by Clause 6.12.4 or for the enclosure of a vertical opening or an exit, shall not have a required fire protection rating and shall not be required to be equipped with self-closing or automatic-closing devices, but shall provide an effective barrier to limit the transfer of smoke and shall be equipped with positive latching. Roller latches are not permitted. Other doors shall conform to Clause 8.16.
4.7.4 Means of escape.

Group I-2 occupancies shall be provided with means of escape complying with Part 11 and Clauses 4.7.4.1 through 4.7.4.4. The fire safety and evacuation plans provided in accordance with Clause 11.2.2 shall identify the building components necessary to support a defend-in-place emergency response in accordance with Clauses 4.3 and 4.4 of the Ghana Fire Code.

4.7.4.1 Direct access to a corridor.
Habitable rooms in Group I-2 occupancies shall have an exit access door leading directly to a corridor.

Exceptions:
1. Rooms with exit doors opening directly to the outside at ground level.
2. Rooms arranged as care suites complying with Clause 4.7.4.4.

4.7.4.1.1 Locking devices.
Locking devices that restrict access to a care recipient’s room from the corridor and that are operable only by staff from the corridor side shall not restrict the means of escape from the care recipient’s room.

Exceptions:
1. This clause shall not apply to rooms in psychiatric treatment and similar care areas.
2. Locking arrangements in accordance with Clause 11.10.1.9.7.

4.7.4.2 Distance of travel.
The distance of travel between any point in a Group I-2 occupancy sleeping room, not located in a care suite, and an exit access door in that room shall be not greater than 15240 mm (50 feet).

4.7.4.3 Projections in nursing home corridors.
In Group I-2, Condition 1 occupancies, where the corridor width is not less than 2440 mm (96 inches), projections shall be permitted for furniture where all of the following criteria are met:

1. The furniture is attached to the floor or to the wall.
2. The furniture does not reduce the clear width of the corridor to less than 1830 mm (72 inches) except where other encroachments are permitted in accordance with Clause 11.5.7.
3. The furniture is positioned on only one side of the corridor.
4. Each arrangement of furniture is 4.6 m² (50 square feet) maximum in area.
5. Furniture arrangements are separated by 3048 mm (10 feet) minimum.
6. Placement of furniture is considered as part of the fire and safety plans in accordance with Clause 11.2.2.

4.7.4.4 Group I-2 care suites.
Care suites in Group I-2 shall comply with Clauses 4.7.4.4.1 through 4.7.4.4.4 and either Clause 4.7.4.4.5 or 4.7.4.4.6.

4.7.4.4.1 Exit access through care suites.
Exit access from all other portions of a building not classified as a care suite shall not pass through a care suite. In a care suite required to have more than one exit, one exit access is permitted to pass through an adjacent care suite provided that all of the other requirements of Clauses 4.7.4 and 11.16.2 are satisfied.

4.7.4.4.2 Separation.
Care suites shall be separated from other portions of the building, including other care suites, by a smoke partition complying with this Code.

4.7.4.4.3 Access to corridor.
Movement from habitable rooms shall not require passage through more than three doors and 30480 mm (100 feet) distance of travel within the suite.

Exception: The distance of travel shall be permitted to be increased to 38100 mm (125 feet) where an automatic smoke detection system is provided throughout the care suite and installed in accordance with this Code.
4.7.4.4 Doors within care suites.
Doors in care suites serving habitable rooms shall be permitted to comply with one of the following:

1. Manually operated horizontal sliding doors permitted in accordance with this Code.

2. Power-operated doors permitted in accordance with this Code.

4.7.4.4.5 Care suites containing sleeping room areas.
Sleeping rooms shall be permitted to be grouped into care suites where one of the following criteria is met:

1. The care suite is not used as an exit access for more than eight care recipient beds.

2. The arrangement of the care suite allows for direct and constant visual supervision into the sleeping rooms by care providers.

3. An automatic smoke detection system is provided in the sleeping rooms and installed in accordance with the Ghana Fire Code.

4.7.4.4.6.2 Exit access.
Care suites, other than sleeping rooms, with an area of more than 232 m² (2,500 square feet) shall have not fewer than two exit access doors from the care suite located in accordance with this Code.

4.7.5 Smoke barriers.
Smoke barriers shall be provided to subdivide every storey used by persons receiving care, treatment or sleeping into not fewer than two smoke compartments. Smoke barriers shall be provided to subdivide other stories with an occupant load of 50 or more persons, into not fewer than two smoke compartments. The smoke barrier shall be in accordance with this Code.

4.7.5.1 Smoke compartment size.
Stories shall be divided into smoke compartments with an area of not more than 2092 m² (22,500 square feet) in Group I-2 occupancies.

Exceptions:

1. A smoke compartment in Group I-2, Condition 2 is permitted to have an area of not more than 3716 m² (40,000 square feet) provided that all patient sleeping rooms within that smoke compartment are configured for single patient occupancy and any suite within the smoke compartment complies with Clause 4.7.4.4.
2. A smoke compartment in Group I-2, Condition 2 without patient sleeping rooms is permitted to have an area of not more than 3716 m$^2$ (40,000 square feet).

4.7.5.2 Exit access travel distance.
The distance of travel from any point in a smoke compartment to a smoke barrier door shall be not greater than 60 960 mm (200 feet).

4.7.5.3 Refuge area.
Refuge areas shall be provided within each smoke compartment. The size of the refuge area shall accommodate the occupants and care recipients from the adjoining smoke compartment. Where a smoke compartment is adjoined by two or more smoke compartments, the minimum area of the refuge area shall accommodate the largest occupant load of the adjoining compartments. The size of the refuge area shall provide the following:

1. Not less than 2.8 m$^2$ (30 net square feet) for each care recipient confined to bed or stretcher.
2. Not less than 0.56 m$^2$ (6 square feet) for each ambulatory care recipient not confined to bed or stretcher and for other occupants.

Areas or spaces permitted to be included in the calculation of refuge area are corridors, sleeping areas, treatment rooms, lounge or dining areas and other low-hazard areas.

4.7.5.4 Independent escape.
A means of escape shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of escape originated. Smoke compartments that do not contain an exit shall be provided with direct access to not less than two adjacent smoke compartments.

4.7.5.5 Horizontal assemblies.
Horizontal assemblies supporting smoke barriers required by this clause shall be designed to resist the movement of smoke. Elevator lobbies shall be in accordance with this Code.

4.7.6 Automatic-closing doors.
Automatic-closing doors with hold-open devices shall comply with Clauses 8.9.5 and 8.16.2.

4.7.7 Automatic sprinkler system.
Smoke compartments containing sleeping rooms shall be equipped throughout with an automatic sprinkler system in accordance with Clauses 10.3.3.1.1 and 10.3.3.2.

4.7.8 Fire alarm system.
A fire alarm system shall be provided in accordance with Clause 10.7.2.6.

4.7.9 Automatic fire detection.
Corridors in Group I-2, Condition 1 occupancies and spaces permitted to be open to the corridors by Clause 4.7.2 shall be equipped with an automatic fire detection system.

Group I-2, Condition 2 occupancies shall be equipped with smoke detection as required in Clause 407.2.

Exceptions:

1. Corridor smoke detection is not required where sleeping rooms are provided with smoke detectors that comply with this Code. Such detectors shall provide a visual display on the corridor side of each sleeping room and an audible and visual alarm at the care provider's station attending each unit.
2. Corridor smoke detection is not required where sleeping room doors are equipped with automatic door-closing devices with integral smoke detectors on the unit sides installed in accordance with their listing, provided that the integral detectors perform the required alerting function.

4.7.10 Secured yards.
Grounds are permitted to be fenced and gates therein are permitted to be equipped with locks, provided that safe dispersal areas having 2.8 m$^2$ (30 net square feet) for bed and stretcher care recipients and 0.56 m$^2$ (6 net square feet) for ambulatory care recipients and other occupants are located between the building and the fence. Such provided safe dispersal areas shall be located not less than 15 240 mm (50 feet) from the building they serve.
4.7.11 Electrical systems.
In Group I-2 occupancies, the essential electrical system for electrical components, equipment and systems shall be designed and constructed in accordance with the provisions of Part 28 and the Ghana Fire Code.

4.8 GROUP I-3

4.8.1 General.
Occupancies in Group I-3 shall comply with the provisions of Clauses 4.8.1 through 4.8.11 and other applicable provisions of Clause 3.8.5.

4.8.2 Other occupancies.
Buildings or portions of buildings in Group I-3 occupancies where security operations necessitate the locking of required means of escape shall be permitted to be classified as a different occupancy. Occupancies classified as other than Group I-3 shall meet the applicable requirements of this Code for that occupancy where provisions are made for the release of occupants at all times.

Means of escape from detention and correctional occupancies that traverse other use areas shall, as a minimum, conform to requirements for detention and correctional occupancies.

Exception: It is permissible to exit through a horizontal exit into other contiguous occupancies that do not conform to detention and correctional occupancy escape provisions but that do comply with requirements set forth in the appropriate occupancy, as long as the occupancy is not a Group H use.

4.8.3 Means of escape.
Except as modified or as provided for in this clause, the means of escape provisions of Part 11 shall apply.

4.8.3.1 Door width.
Doors to resident sleeping units shall have a clear width of not less than 711 mm (28 inches).

4.8.3.2 Sliding doors.
Where doors in a means of escape are of the horizontal-sliding type, the force to slide the door to its fully open position shall be not greater than 220 N (50 pounds) with a perpendicular force against the door of 220 N (50 pounds).

4.8.3.3 Guard tower doors.
A hatch or trap door not less than $610 \text{ m}^2$ (16 square feet) in area through the floor and having dimensions of not less than 610 mm (2 feet) in any direction shall be permitted to be used as a portion of the means of escape from guard towers.

4.8.3.4 Spiral stairways.
Spiral stairways that conform to the requirements of this Code are permitted for access to and between staff locations.

4.8.3.5 Ships ladders.
Ships ladders shall be permitted for escape from control rooms or elevated facility observation rooms in accordance with this Code.

4.8.3.6 Exit discharge.
Exits are permitted to discharge into a fenced or walled courtyard. Enclosed yards or courts shall be of a size to accommodate all occupants, be located not less than 15 240 mm (50 feet) from the building and have an area of not less than $1.4 \text{ m}^2$ (15 square feet) per person.

4.8.3.7 Sallyports.
A sallyport shall be permitted in a means of escape where there are provisions for continuous and unobstructed passage through the sallyport during an emergency escape condition.

4.8.3.8 Interior exit stairway and ramp construction.
One interior exit stairway or ramp in each building shall be permitted to have glazing installed in doors and interior walls at each landing level providing access to the interior exit stairway or ramp, provided that the following conditions are met:

1. The interior exit stairway or ramp shall not serve more than four floor levels.

2. Exit doors shall be not less than $\frac{3}{4}$ -hour fire door assemblies complying with this Code.
3. The total area of glazing at each floor level shall not exceed 3.2 m² (5,000 square inches) and individual panels of glazing shall not exceed 0.84 m² (1,296 square inches).

4. The glazing shall be protected on both sides by an automatic sprinkler system. The sprinkler system shall be designed to wet completely the entire surface of any glazing affected by fire when actuated.

5. The glazing shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler system operates.

6. Obstructions, such as curtain rods, drapery traverse rods, curtains, drapes or similar materials shall not be installed between the automatic sprinklers and the glazing.

4.8.4 Locks.

Escape doors are permitted to be locked in accordance with the applicable use condition. Doors from a refuge area to the outside are permitted to be locked with a key in lieu of locking methods described in Clause 4.8.4.1. The keys to unlock the exterior doors shall be available at all times and the locks shall be operable from both sides of the door.

4.8.4.1 Remote release.

Remote release of locks on doors in a means of escape shall be provided with reliable means of operation, remote from the resident living areas, to release locks on all required doors. In Occupancy Condition 3 or 4, the arrangement, accessibility and security of the release mechanisms required for escape shall be such that with the minimum available staff at any time, the lock mechanisms are capable of being released within 2 minutes.

Exception: Provisions for remote locking and unlocking of occupied rooms in Occupancy Condition 4 are not required provided that not more than 10 locks are necessary to be unlocked in order to move occupants from one smoke compartment to a refuge area within 3 minutes. The opening of necessary locks shall be accomplished with not more than two separate keys.

4.8.4.2 Power-operated doors and locks.

Power-operated sliding doors or power-operated locks for swinging doors shall be operable by a manual release mechanism at the door. Emergency power shall be provided for the doors and locks in accordance with this Code.

Exceptions:

1. Emergency power is not required in facilities with 10 or fewer locks complying with the exception to Clause 4.8.4.1.

2. Emergency power is not required where remote mechanical operating releases are provided.

4.8.4.3 Redundant operation.

Remote release, mechanically operated sliding doors or remote release, mechanically operated locks shall be provided with a mechanically operated release mechanism at each door, or shall be provided with a redundant remote release control.

4.8.4.4 Relock capability.

Doors remotely unlocked under emergency conditions shall not automatically relock when closed unless specific action is taken at the remote location to enable doors to relock.

4.8.5 Protection of vertical openings.

Any vertical opening shall be protected by a shaft enclosure in accordance with Clause 8.13 or shall be in accordance with Clause 4.8.5.1.

4.8.5.1 Floor openings.

Openings in floors within a housing unit are permitted without a shaft enclosure, provided that all of the following conditions are met:

1. The entire normally occupied areas so interconnected are open and unobstructed so as to enable observation of the areas by supervisory personnel.

2. Means of escape capacity is sufficient for all occupants from all interconnected cell tiers and areas.
3. The height difference between the floor levels of the highest and lowest cell tiers shall not exceed 23 feet (7010 mm).

4. Escape from any portion of the cell tier to an exit or exit access door shall not require travel on more than one additional floor level within the housing unit.

4.8.5.2 Shaft openings in communicating floor levels.

Where a floor opening is permitted between communicating floor levels of a housing unit in accordance with Clause 4.8.5.1, plumbing chases serving vertically staked individual cells contained within the housing unit shall be permitted without a shaft enclosure.

4.8.6 Smoke barrier.

Occupancies in Group I-3 shall have smoke barriers complying with Clauses 4.8.6 and 8.9 to divide every storey occupied by residents for sleeping, or any other storey having an occupant load of 50 or more persons, into not fewer than two smoke compartments.

Exception: Spaces having a direct exit to one of the following, provided that the locking arrangement of the doors involved complies with the requirements for doors at the smoke barrier for the use condition involved:

1. A public way.
2. A building separated from the resident housing area by a 2-hour fire-resistance-rated assembly or 15 240 mm (50 feet) of open space.
3. A secured yard or court having a holding space 15 240 mm (50 feet) from the housing area that provides 0.56 m$^2$ (6 square feet) or more of refuge area per occupant, including residents, staff and visitors.

4.8.6.1 Smoke compartments.

The number of residents in any smoke compartment shall not be more than 200. The distance of travel to a door in a smoke barrier from any room door required as exit access shall be not greater than 45 720 mm (150 feet). The distance of travel to a door in a smoke barrier from any point in a room shall be not greater than 200 feet (60 960 mm).

4.8.6.2 Refuge area.

Not less than 0.56 m$^2$ (6 net square feet) per occupant shall be provided on each side of each smoke barrier for the total number of occupants in adjoining smoke compartments. This space shall be readily available wherever the occupants are moved across the smoke barrier in a fire emergency.

4.8.6.3 Independent escape.

A means of escape shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of escape originates.

4.8.7 Security glazing.

In occupancies in Group I-3, windows and doors in 1-hour fire barriers constructed in accordance with Clause 8.7 fire partitions constructed in accordance with Clause 8.8 and smoke barriers constructed in accordance with Clause 8.9 shall be permitted to have security glazing installed provided that the following conditions are met.

1. Individual panels of glazing shall not exceed 0.84 m$^2$ (1,296 square inches).
2. The glazing shall be protected on both sides by an automatic sprinkler system. The sprinkler system shall be designed to, when actuated, wet completely the entire surface of any glazing affected by fire.
3. The glazing shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler system operates.
4. Obstructions, such as curtain rods, drapery traverse rods, curtains, drapes or similar materials shall not be installed between the automatic sprinklers and the glazing.
4.8.8 Subdivision of resident housing areas.
Sleeping areas and any contiguous day room, group activity space or other common spaces where residents are housed shall be separated from other spaces in accordance with Clauses 4.8.8.1 through 4.8.8.4.

4.8.8.1 Occupancy Conditions 3 and 4.
Each sleeping area in Occupancy Conditions 3 and 4 shall be separated from the adjacent common spaces by a smoke-tight partition where the distance of travel from the sleeping area through the common space to the corridor exceeds 15 240 mm (50 feet).

4.8.8.2 Occupancy Condition 5.
Each sleeping area in Occupancy Condition 5 shall be separated from adjacent sleeping areas, corridors and common spaces by a smoke-tight partition. Additionally, common spaces shall be separated from the corridor by a smoke-tight partition.

4.8.8.3 Openings in room face.
The aggregate area of openings in a solid sleeping room face in Occupancy Conditions 2, 3, 4 and 5 shall not exceed 0.77 m² (120 square inches). The aggregate area shall include all openings including door undercuts, food passes and grilles. Openings shall be not more than 914 mm (36 inches) above the floor. In Occupancy Condition 5, the openings shall be closeable from the room side.

4.8.8.4 Smoke-tight doors.
Doors in openings in partitions required to be smoke tight by Clause 4.8.8 shall be substantial doors, of construction that will resist the passage of smoke. Latches and door closures are not required on cell doors.

4.8.9 Windowless buildings.
For the purposes of this clause, a windowless building or portion of a building is one with nonopenable windows, windows not readily breakable or without windows. Windowless buildings shall be provided with an engineered smoke control system to provide a tenable environment for exiting from the smoke compartment in the area of fire origin in accordance with Clause 10.9 for each windowless smoke compartment.

4.8.10 Fire alarm system.
A fire alarm system shall be provided in accordance with Clause 10.7.2.6.3.

4.8.11 Automatic sprinkler system.
Group I-3 occupancies shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.2.6.

4.9 MOTION PICTURE PROJECTION ROOMS

4.9.1 General.
The provisions of Clauses 4.9.1 through 4.9.5 shall apply to rooms in which ribbon-type cellulose acetate or other safety film is utilized in conjunction with electric arc, xenon or other light-source projection equipment that develops hazardous gases, dust or radiation. Where cellulose nitrate film is utilized or stored, such rooms shall comply with the Ghana Fire Code.

4.9.1.1 Projection room required.
Every motion picture machine projecting film as mentioned within the scope of this clause shall be enclosed in a projection room. Appurtenant electrical equipment, such as rheostats, transformers and generators, shall be within the projection room or in an adjacent room of equivalent construction.

4.9.2 Construction of projection rooms.
Every projection room shall be of permanent construction consistent with the construction requirements for the type of building in which the projection room is located. Openings are not required to be protected. The room shall have a floor area of not less than 80 square feet (7.44 m²) for a single machine and not less than 3.7 m² (40 square feet) for each additional machine. Each motion picture projector, floodlight, spotlight or similar piece of equipment shall have a clear working space of not less than 762 mm by 762 mm (30 inches by 30 inches) on each side and at the rear thereof, but only one such space shall be required between two adjacent projectors. The projection room and the rooms appurtenant thereto shall have a ceiling height of not less than 2286 mm (7 feet 6 inches). The aggregate of openings for projection equipment shall not exceed 25 percent of the area of the wall between the projection room and the auditorium. Openings shall be provided with
glass or other approved material, so as to close completely the opening.

4.9.3 Projection room and equipment ventilation.
Ventilation shall be provided in accordance with this Code.

4.9.3.1 Supply air.
Each projection room shall be provided with adequate air supply inlets so arranged as to provide well-distributed air throughout the room. Air inlet ducts shall provide an amount of air equivalent to the amount of air being exhausted by projection equipment. Air is permitted to be taken from the outside; from adjacent spaces within the building, provided that the volume and infiltration rate are sufficient; or from the building air-conditioning system, provided that it is so arranged as to provide sufficient air when other systems are not in operation.

4.9.3.2 Exhaust air.
Projection rooms are permitted to be exhausted through the lamp exhaust system. The lamp exhaust system shall be positively interconnected with the lamp so that the lamp will not operate unless there is the required airflow. Exhaust air ducts shall terminate at the exterior of the building in such a location that the exhaust air cannot be readily recirculated into any air supply system. The projection room ventilation system is permitted to also serve appurtenant rooms, such as the generator and rewind rooms.

4.9.3.3 Projection machines.
Each projection machine shall be provided with an exhaust duct that will draw air from each lamp and exhaust it directly to the outside of the building. The lamp exhaust is permitted to serve to exhaust air from the projection room to provide room air circulation. Such ducts shall be of rigid materials, except for a flexible connector approved for the purpose. The projection lamp or projection room exhaust system, or both, is permitted to be combined but shall not be interconnected with any other exhaust or return system, or both, within the building.

4.9.4 Lighting control.
Provisions shall be made for control of the auditorium lighting and the means of escape lighting systems of theaters from inside the projection room and from not less than one other convenient point in the building.

4.9.5 Miscellaneous equipment.
Each projection room shall be provided with rewind and film storage facilities.

4.10 STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

4.10.1 Applicability.
The provisions of Clauses 4.10.1 through 4.10.7 shall apply to all parts of buildings and structures that contain stages or platforms and similar appurtenances as herein defined.

4.10.2 Stages.
Stage construction shall comply with Clauses 4.10.2.1 through 4.10.2.7.

4.10.2.1 Stage construction.
Stages shall be constructed of materials as required for floors of the type of construction of the building. Stages need not be constructed of the same materials as required for the type of construction provided that the construction complies with one of the following:

1. Stages of Type IB or III construction with a nominal 51 mm (2-inch) wood deck, provided that the stage is separated from other areas in accordance with Clause 4.10.2.4.

2. In buildings of Type IA, IIA and IVA construction, a fire-resistance-rated floor is not required, provided that the space below the stage is equipped with an automatic sprinkler system or fire-extinguishing system in accordance with Clause 10.3 or 10.4.

3. In all types of construction, the finished floor shall be constructed of wood or approved noncombustible materials. Openings through
4.10.2.1 Stage height and area.

Stage areas shall be measured to include the entire performance area and adjacent backstage and support areas not separated from the performance area by fire-resistance-rated construction. Stage height shall be measured from the lowest point on the stage floor to the highest point of the roof or floor deck above the stage.

4.10.2.2 Technical production areas: galleries, gridirons and catwalks.

Beams designed only for the attachment of portable or fixed theater equipment, gridirons, galleries and catwalks shall be constructed of approved materials consistent with the requirements for the type of construction of the building; and a fire-resistance rating shall not be required. These areas shall not be considered to be floors, stories, mezzanines or levels in applying this Code.

Exception: Floors of fly galleries and catwalks shall be constructed of any approved material.

4.10.2.3 Exterior stage doors.

Where protection of openings is required, exterior exit doors shall be protected with fire door assemblies that comply with Clause 8.16. Exterior openings that are located on the stage for means of escape or loading and unloading purposes, and that are likely to be open during occupancy of the theater, shall be constructed with vestibules to prevent air drafts into the auditorium.

4.10.2.4 Proscenium wall.

Where the stage height is greater than 15 240 mm (50 feet), all portions of the stage shall be completely separated from the seating area by a proscenium wall with not less than a 2-hour fire-resistance rating extending continuously from the foundation to the roof.

4.10.2.5 Proscenium curtain.

Where a proscenium wall is required to have a fire-resistance rating, the stage opening shall be provided with a fire curtain complying with the Ghana Fire Code. Horizontal sliding doors shall comply with Clause 8.16 and have a fire protection rating of not less than 1 hour, or an approved water curtain complying with Clause 10.3.3.1.1. Facilities not utilizing the provisions of smoke-protected assembly seating in accordance with Clause 11.29.6.2, a smoke control system complying with Clause 10.9 or natural ventilation designed to maintain the smoke level not less than 1829 mm (6 feet) above the floor of the means of escape shall be required.

4.10.2.6 Scenery.

Combustible materials used in sets and scenery shall meet the fire propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of ASTM E84, in accordance with Clause 9.6 and the Ghana Fire Code. Foam plastics and materials containing foam plastics shall comply with Clause 27.3 and the Ghana Fire Code.

4.10.2.7 Stage ventilation.

Emergency ventilation shall be provided for stages larger than 93 m² (1,000 square feet) in floor area, or with a stage height greater than 15 240 mm (50 feet). Such ventilation shall comply with Clause 4.10.2.7.1 or 4.10.2.7.2.

4.10.2.7.1 Roof vents.

Two or more vents constructed to open automatically by approved heat-activated devices and with an aggregate clear opening area of not less than 5 percent of the area of the stage shall be located near the center and above the highest part of the stage area. Supplemental means shall be provided for manual operation of the ventilator. Curbs shall be provided as required for skylights in Clause 27.10.2. Vents shall be labeled.

4.10.2.7.2 Smoke control.

Smoke control in accordance with Clause 10.9 shall be provided to maintain the smoke layer interface not less than 1829 mm (6 feet) above the highest level of the assembly seating or above the top of the proscenium opening where a proscenium wall is provided in compliance with this Code.
4.10.3 Platform construction.

Permanent platforms shall be constructed of materials as required for the type of construction of the building in which the permanent platform is located. Permanent platforms are permitted to be constructed of fire-retardant-treated wood for Types I and III construction where the platforms are not more than 762 mm (30 inches) above the main floor, and not more than one-third of the room floor area and not more than 279 m² (3,000 square feet) in area. Where the space beneath the permanent platform is used for storage or any purpose other than equipment, wiring or plumbing, the floor assembly shall be not less than 1-hour fire-resistance-rated construction. Where the space beneath the permanent platform is used only for equipment, wiring or plumbing, the underside of the permanent platform need not be protected.

4.10.3.1 Temporary platforms.

Platforms installed for a period of not more than 30 days are permitted to be constructed of any materials permitted by this Code. The space between the floor and the platform above shall only be used for plumbing and electrical wiring to platform equipment.

4.10.4 Dressing and appurtenant rooms.

Dressing and appurtenant rooms shall comply with Clauses 4.10.4.1 and 4.10.4.2.

4.10.4.1 Separation from stage.

The stage shall be separated from dressing rooms, scene docks, property rooms, workshops, storerooms and compartments appurtenant to the stage and other parts of the building by fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. The fire-resistance rating shall be not less than 2 hours for stage heights greater than 15 240 mm (50 feet) and not less than 1 hour for stage heights of 15 240 mm (50 feet) or less.

4.10.4.2 Separation from each other.

Dressing rooms, scene docks, property rooms, workshops, storerooms and compartments appurtenant to the stage shall be separated from each other by not less than 1-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

4.10.5 Means of escape.

Except as modified or as provided for in this clause, the provisions of Part 11 shall apply.

4.10.5.1 Arrangement.

Where two or more exits or exit access doorways from the stage are required in accordance with Clause 11.6.2, not fewer than one exit or exit access doorway shall be provided on each side of a stage.

4.10.5.2 Stairway and ramp enclosure.

Exit access stairways and ramps serving a stage or platform are not required to be enclosed. Exit access stairways and ramps serving technical production areas are not required to be enclosed.

4.10.5.3 Technical production areas.

Technical production areas shall be provided with means of escape and means of escape in accordance with Clauses 4.10.5.3.1 through 4.10.5.3.5.

4.10.5.3.1 Number of means of escape.

At least one means of escape shall be provided from technical production areas.

4.10.5.3.2 Exit access travel distance.

The exit access travel distance shall be not greater than 91 440 mm (300 feet) for buildings without a sprinkler system and 122 mm (400 feet) for buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

4.10.5.3.3 Two means of escape.

Where two means of escape are required, the common path of travel shall be not greater than 30 480 mm (100 feet).

Exception: A means of escape to a roof in place of a second means of escape is permitted.

4.10.5.3.4 Path of escape travel.

The following exit access components are permitted where serving technical production areas:

1. Stairways.
2. Ramps.
3. Spiral stairways.
5. Alternating tread devices.

6. Permanent ladders.

4.10.5.3.5 Width.
The path of escape travel within and from technical support areas shall be not less than 559 mm (22 inches).

4.10.6 Automatic sprinkler system.

Stages shall be equipped with an automatic sprinkler system in accordance with Clause 10.3.3.1.1. Sprinklers shall be installed under the roof and gridiron and under all catwalks and galleries over the stage. Sprinklers shall be installed in dressing rooms, performer lounges, shops and storerooms accessory to such stages.

Exceptions:

1. Sprinklers are not required under stage areas less than 1219 mm (4 feet) in clear height that are utilized exclusively for storage of tables and chairs, provided that the concealed space is separated from the adjacent spaces by Type X gypsum board not less than 15.9 mm (5/8 inch) in thickness.

2. Sprinklers are not required for stages 93 m² (1,000 square feet) or less in area and 15 240 mm (50 feet) or less in height where curtains, scenery or other combustible hangings are not retractable vertically. Combustible hangings shall be limited to a single main curtain, borders, legs and a single backdrop.

3. Sprinklers are not required within portable orchestra enclosures on stages.

4.11 SPECIAL AMUSEMENT BUILDINGS

4.11.1 General.

Special amusement buildings having an occupant load of 50 or more shall comply with the requirements for the appropriate Group A occupancy and Clauses 4.11.1 through 4.11.7. Special amusement buildings having an occupant load of less than 50 shall comply with the requirements for a Group B occupancy and Clauses 4.11.1 through 4.11.7.

Exception: Special amusement buildings or portions thereof that are without walls or a roof and constructed to prevent the accumulation of smoke need not comply with this clause.

For flammable decorative materials, see the Ghana Fire Code.

4.11.2 Automatic fire detection.

Special amusement buildings shall be equipped with an automatic fire detection system in accordance with this Code.

4.11.3 Automatic sprinkler system.

Special amusement buildings shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1. Where the special amusement building is temporary, the sprinkler water supply shall be of an approved temporary means.

Exception: Automatic sprinklers are not required where the total floor area of a temporary special amusement building is less than 93 m² (1,000 square feet) and the exit access travel distance from any point to an exit is less than 15 240 mm (50 feet).

4.11.4 Alarm.

Actuation of a single smoke detector, the automatic sprinkler system or other automatic fire detection device shall immediately sound an alarm at the building at a constantly attended location from which emergency action can be initiated including the capability of manual initiation of requirements in Clause 10.7.2.11.

4.11.5 Emergency voice/alarm communications system.

An emergency voice/alarm communications system shall be provided in accordance with Clauses 10.7.2.11 and 10.7.5.2.2 is permitted to serve as a public address system and shall...
be audible throughout the entire special amusement building.

### 4.11.6 Exit marking.

Exit signs shall be installed at the required exit or exit access doorways of amusement buildings in accordance with this clause and Clause 11.13. Approved directional exit markings shall be provided. Where mirrors, mazes or other designs are utilized that disguise the path of escape travel such that they are not apparent, approved and listed low-level exit signs that comply with Clause 11.13.5, and directional path markings listed in accordance with this Code shall be provided and located not more than 203 mm (8 inches) above the walking surface and on or near the path of escape travel. Such markings shall become visible in an emergency. The directional exit marking shall be activated by the automatic fire detection system and the automatic sprinkler system in accordance with Clause 10.7.2.11.

#### 4.11.6.1 Photoluminescent exit signs.

Where photoluminescent exit signs are installed, activating light source and viewing distance shall be in accordance with the listing and markings of the signs.

### 4.11.7 Interior finish.

The interior finish shall be Class A in accordance with Clause 9.3.1.

### 4.12 AIRCRAFT-RELATED OCCUPANCIES

#### 4.12.1 General.

Aircraft-related occupancies shall comply with Clauses 4.12.1 through 4.12.6 and the Ghana Fire Code.

#### 4.12.2 Airport traffic control towers.

The provisions of Clauses 4.12.2.1 through 4.12.2.6 shall apply to airport traffic control towers occupied only for the following uses:

1. Airport traffic control cab.
2. Electrical and mechanical equipment rooms.
3. Airport terminal radar and electronics rooms.
4. Office spaces incidental to the tower operation.

5. Lounges for employees, including sanitary facilities.

### 4.12.2.1 Construction.

The construction of airport traffic control towers shall comply with the provisions of Clauses 4.12.2.1.1 through 4.12.2.1.3.

#### 4.12.2.1.1 Type of construction.

Airport traffic control towers shall be constructed to comply with the height limitations of Table 4.12.2.1.1.

#### TABLE 4.12.2.1.1

<table>
<thead>
<tr>
<th>TYPE OF CONSTRUCTION</th>
<th>HEIGHT</th>

</tr>
</tbody>
</table>

**NOTE:** For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².  
  a. Height to be measured from grade plane to cab floor.

#### 4.12.2.1.2 Structural integrity of interior exit stairways and elevator hoistway enclosures.

Enclosures for interior exit stairways and elevator hoistway enclosures shall comply with Clause 4.3.2.3 in airport traffic control towers where the control cab is located more than 22 860 mm (75 feet) above the lowest level of fire department vehicle access.

#### 4.12.2.1.3 Sprayed fire-resistant materials (SFRM).

The bond strength of the SFRM installed in airport traffic control towers shall be in accordance with Clause 4.3.2.4 where the control cab is located more than 22 860 mm (75 feet) above the lowest level of fire department vehicle access.

#### 4.12.2.2 Means of escape and evacuation.

The means of escape in airport traffic control towers shall comply with Clauses 4.12.2.2.1 through 4.12.2.2.3.
4.12.2.2.1 Stairways.
Stairways in airport traffic control towers shall be in accordance with Clause 11.11. Exit stairways shall be smokeproof enclosures complying with one of the alternatives provided in Clause 10.9.20.

Exception: Stairways in airport traffic control towers are not required to comply with Clause 11.11.12.

4.12.2.2 Exit access.
From observation levels, airport traffic control towers shall be permitted to have a single means of exit access for a distance of travel not greater than 30 480 mm (100 feet). Exit access stairways from the observation level need not be enclosed.

4.12.2.2.3 Number of exits.
Not less than one exit stairway shall be permitted for airport traffic control towers of any height provided that the occupant load per floor is not greater than 15 and the area per floor does not exceed 140 m$^2$ (1,500 square feet).

4.12.2.2.3.1 Interior finish.
Where an airport traffic control tower is provided with only one exit stairway, interior wall and ceiling finishes shall be either Class A or Class B.

4.12.2.2.3.2 Exit separation.
Where an airport traffic control tower is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 and two exits are required, the exit separation distance required by Clause 11.7 shall be not less than one-fourth of the length of the maximum overall dimension of the area served.

4.12.2.3 Emergency systems.
The detection, alarm and emergency systems of airport traffic control towers shall comply with Clauses 4.12.2.3.1 through 4.12.2.3.3.

4.12.2.3.1 Automatic smoke detection systems.
Airport traffic control towers shall be provided with an automatic smoke detection system installed in accordance with Clause 10.7.2.21.

4.12.2.3.2 Fire command center.
A fire command center shall be provided in airport traffic control towers where the control cab is located more than 22 860 mm (75 feet) above the lowest level of fire department vehicle access. The fire command center shall comply with Clause 10.11.

Exceptions:
1. The fire command center shall be located in the airport control tower or an adjacent contiguous building where building functions are interdependent.
2. The room shall be not less than 14 m$^2$ (150 square feet) in area with a minimum dimension of 3048 mm (10 feet).
3. The following features shall not be required in an airport traffic control tower fire command center.
   3.1. Emergency voice/alarm control unit.
   3.2. Public address system.
   3.3. Status indicators and controls for the air distributions centers.
   3.4. Generator supervision devices, manual start and transfer features.
   3.5. Elevator emergency or standby power switches where emergency or standby power is provided.

4.12.2.3.3 Smoke removal.
Smoke removal in airport traffic control towers shall be provided in accordance with Clause 4.3.4.7.

4.12.2.4 Automatic sprinkler system.
Where an occupied floor is located more than 10 668 mm (35 feet) above the lowest level of fire department vehicle access, airport traffic control towers shall be equipped with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.
4.12.2.4.1 Fire pump room.

Fire pumps shall be located in rooms that are separated from all other areas of the building by 2-hour fire barriers constructed in accordance with Clause 8.7 or 2-hour horizontal assemblies constructed in accordance with Clause 8.11, or both.

**Exception:** Separation is not required for fire pumps physically separated in accordance with the Ghana Fire Code.

4.12.2.5 Protection of elevator wiring and cables.

Wiring and cables serving elevators in airport traffic control towers shall be protected in accordance with this Code.

4.12.2.5.1 Elevators for occupant evacuation.

Where provided in addition to an exit stairway, occupant evacuation elevators shall be in accordance with this Code.

4.12.2.6 Accessibility.

Airport traffic control towers shall be accessible except as specified in this Code.

4.12.3 Aircraft hangars.

Aircraft hangars shall be in accordance with Clauses 4.12.3.1 through 4.12.3.6.

4.12.3.1 Exterior walls.

Exterior walls located less than 9144 mm (30 feet) from plot lines or a public way shall have a fire-resistance rating not less than 2 hours.

4.12.3.2 Basements.

Where hangars have basements, floors over basements shall be of Type IA construction and shall be made tight against seepage of water, oil or vapours. There shall not be openings or communication between basements and the hangar. Access to basements shall be from outside only.

4.12.3.3 Floor surface.

Floors shall be graded and drained to prevent water or fuel from remaining on the floor. Floor drains shall discharge through an oil separator to the sewer or to an outside vented sump.

**Exception:** Aircraft hangars with individual lease spaces not exceeding 186 m² (2,000 square feet) each in which servicing, repairing or washing is not conducted and fuel is not dispensed shall have floors that are graded toward the door, but shall not require a separator.

4.12.3.4 Heating equipment.

Heating equipment shall be placed in another room separated by 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. Entrance shall be from the outside or by means of a vestibule providing a two-doorway separation.

**Exceptions:**

1. Unit heaters and vented infrared radiant heating equipment suspended not less than 3048 mm (10 feet) above the upper surface of wings or engine enclosures of the highest aircraft that are permitted to be housed in the hangar need not be located in a separate room provided that they are mounted not less than 2438 mm (8 feet) above the floor in shops, offices and other clauses of the hangar communicating with storage or service areas.

2. Entrance to the separated room shall be permitted by a single interior door provided that the sources of ignition in the appliances are not less than 457 mm (18 inches) above the floor.

4.12.3.5 Finishing.

The process of “doping,” involving use of a volatile flammable solvent, or of painting, shall be carried on in a separate detached building equipped with automatic fire-extinguishing equipment in accordance with Clause 10.3.

4.12.3.6 Fire suppression.

Aircraft hangars shall be provided with a fire suppression system designed in accordance with the Ghana Fire Code, based on the classification for the hangar given in Table 4.12.3.6.
Exception: Where a fixed base operator has separate repair facilities on site, Group II hangars operated by a fixed base operator used for storage of transient aircraft only shall have a fire suppression system, but the system is exempt from foam requirements.

</tr>
</tbody>
</table>

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

a. Aircraft hangars with a door height greater than 28 feet shall be provided with fire suppression for a Group I hangar regardless of maximum fire area.

b. Groups shall be as classified in accordance with the Ghana Fire Code.

c. Membrane structures complying with Clause 32.2 shall be classified as a Group IV hangar.

4.12.3.6.1 Hazardous operations.

Any Group III aircraft hangar according to Table 4.12.3.6 that contains hazardous operations including, but not limited to, the following shall be provided with a Group I or II fire suppression system in accordance with the Ghana Fire Code as applicable:

1. Doping.

2. Hot work including, but not limited to, welding, torch cutting and torch soldering.

3. Fuel transfer.

4. Fuel tank repair or maintenance not including defueled tanks in accordance with the Ghana Fire Code, inerted tanks or tanks that have never been fueled.

5. Spray finishing operations.

6. Total fuel capacity of all aircraft within the unsprinklered single fire area in excess of 6057 L (1,600 gallons).

7. Total fuel capacity of all aircraft within the maximum single fire area in excess of 28390 L (7,500 gallons) for a hangar with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

4.12.3.6.2 Separation of maximum single fire areas.

Maximum single fire areas established in accordance with hangar classification and construction type in Table 4.12.3.6 shall be separated by 2-hour fire walls constructed in accordance with Clause 8.6. In determining the maximum single fire area as set forth in Table 4.12.3.6, ancillary uses that are separated from aircraft servicing areas by a fire barrier of not
less than 1 hour, constructed in accordance with Clause 8.7, shall not be included in the area.

4.12.4 Residential aircraft hangars.
Residential aircraft hangars shall comply with Clauses 4.12.4.1 through 4.12.4.5.

4.12.4.1 Fire separation.
A hangar shall not be attached to a dwelling unless separated by a fire barrier having a fire-resistance rating of not less than 1 hour. Such separation shall be continuous from the foundation to the underside of the roof and unperforated except for doors leading to the dwelling unit. Doors into the dwelling unit shall be equipped with self-closing devices and conform to the requirements of Clause 8.16 with a noncombustible raised sill not less than 102 mm (4 inches) in height. Openings from a hangar directly into a room used for sleeping purposes shall not be permitted.

4.12.4.2 Escape.
A hangar shall provide two means of escape. One of the doors into the dwelling shall be considered as meeting only one of the two means of escape.

4.12.4.3 Smoke alarms.
Smoke alarms shall be provided within the hangar in accordance with Clause 10.7.2.21.

4.12.4.4 Independent systems.
Electrical, mechanical and plumbing drain, waste and vent (DWV) systems installed within the hangar shall be independent of the systems installed within the dwelling. Building sewer lines shall be permitted to be connected outside the structures.

Exception: Smoke detector wiring and feed for electrical subpanels in the hangar.

4.12.4.5 Height and area limits.
Residential aircraft hangars shall be not greater than 186 m² (2,000 square feet) in area and 6096 mm (20 feet) in building height.

4.12.5 Aircraft paint hangars.
Aircraft painting operations shall be conducted in an aircraft paint hangar that complies with the provisions of Clauses 4.12.5.1 through 4.12.5.8. Buildings and structures, or parts thereof, used for the application of flammable finishes shall comply with the applicable provisions of Clause 4.16.

4.12.5.1 Occupancy classification.
Aircraft paint hangars shall be classified in accordance with the provisions of Clause 3.7.1. Aircraft paint hangars shall comply with the applicable requirements of this Code and the Ghana Fire Code for such occupancy.

4.12.5.2 Construction.
Aircraft paint hangars shall be of Type I construction.

4.12.5.3 Spray equipment cleaning operations.
Spray equipment cleaning operations shall be conducted in a liquid use, dispensing and mixing room.

4.12.5.4 Operations.
Only those flammable liquids necessary for painting operations shall be permitted in quantities less than the maximum allowable quantities per control area in Table 3.7.1(1). Spray equipment cleaning operations exceeding the maximum allowable quantities per control area in Table 3.7.1(1) shall be conducted in a liquid use, dispensing and mixing room.

4.12.5.5 Storage.
Storage of flammable or combustible liquids exceeding the maximum allowable quantities per control area in Table 3.7.1(1) shall be in a liquid storage room.

4.12.5.6 Fire suppression.
Aircraft paint hangars shall be provided with fire suppression as required by the Ghana Fire Code.

4.12.5.7 Ventilation.
Aircraft paint hangars shall be provided with ventilation as required in this Code.

4.12.5.8 Electrical.
Electrical equipment and devices within the aircraft paint hangar shall comply with Ghana Wiring Code.
4.12.5.8.1 Class I, Division I hazardous locations.
The area within 3048 mm (10 feet) horizontally from aircraft surfaces and from the floor to 3048 mm (10 feet) above the aircraft surface shall be classified as a Class I, Division I location.

4.12.5.8.2 Class I, Division 2 hazardous locations.
The area horizontally from aircraft surfaces between 3048 mm (10 feet) and 9144 mm (30 feet) and from the floor to 9144 mm (30 feet) above the aircraft surface shall be classified as a Class I, Division 2 location.

4.12.6 Heliports and helistops.
Heliports and helistops shall be permitted to be erected on buildings or other locations where they are constructed in accordance with Clauses 4.12.6.1 through 4.12.6.5.

4.12.6.1 Size.
The landing area for helicopters less than 1588 kg (3,500 pounds) shall be not less than 6096 mm (20 feet) in length and width. The landing area shall be surrounded on all sides by a clear area having an average width at roof level of 4572 mm (15 feet), and all widths shall be not less than 1524 mm (5 feet).

4.12.6.2 Design.
Helicopter landing areas and the supports thereof on the roof of a building shall be noncombustible construction. Landing areas shall be designed to confine any flammable liquid spillage to the landing area itself and provisions shall be made to drain such spillage away from any exit or stairway serving the helicopter landing area or from a structure housing such exit or stairway.

4.12.6.3 Means of escape.
The means of escape from heliports and helistops shall comply with the provisions of Part 11. Landing areas located on buildings or structures shall have two or more means of escape. For landing areas less than 18 288 mm² (60 feet) in length or less than 186 m² (2,000 square feet) in area, the second means of escape is permitted to be a fire escape, alternating tread device or ladder leading to the floor below.

4.12.6.4 Rooftop heliports and helistops.
Rooftop heliports and helistops shall comply with NFPA 418.

4.12.6.5 Fire hydrant system.
In buildings equipped with a Fire hydrant system, the Fire hydrant shall extend to the roof level in accordance with Clause 10.5.3.6.

4.13 COMBUSTIBLE STORAGE

4.13.1 General.
High-piled stock or rack storage in any occupancy group shall comply with the Ghana Fire Code.

4.13.2 Attic, under-floor and concealed spaces.
Attic, under-floor and concealed spaces used for storage of combustible materials shall be protected on the storage side as required for 1-hour fire-resistance-rated construction. Openings shall be protected by assemblies that are self-closing and are of noncombustible construction or solid wood core not less than 45 mm (1 3/4 inch) in thickness.

Exception: Neither fire-resistance-rated construction nor opening protectives are required in any of the following locations:

1. Areas protected by approved automatic sprinkler systems.
2. Group R-3 and U occupancies.

4.14 HAZARDOUS MATERIALS

The provisions of Clauses 4.14.1 through 4.14.6 shall apply to buildings and structures occupied for the manufacturing, processing, dispensing, use or storage of hazardous materials.

4.14.1.1 Other provisions.
Buildings and structures with an occupancy in Group H shall comply with this clause and the applicable provisions of Clause 4.15 and the Ghana Fire Code.
The safe design of hazardous material occupancies is material dependent. Individual material requirements are found in Clauses 3.7, 4.15 and the Ghana Fire Code.

4.14.1.2.1 Aerosol products.
Level 2 and 3 aerosol products shall be stored and displayed in accordance with the Ghana Fire Code. See Clause 3.11.2 and the Ghana Fire Code for occupancy group requirements.

4.14.1.3 Information required.
A report shall be submitted to the building official identifying the maximum expected quantities of hazardous materials to be stored, used in a closed system and used in an open system, and subdivided to separately address hazardous material classification categories based on Tables 3.7.1(1) and 3.7.1(2). The methods of protection from such hazards, including but not limited to control areas, fire protection systems and Group H occupancies shall be indicated in the report and on the construction documents. The opinion and report shall be prepared by a qualified person, firm or corporation approved by the building official and provided without charge to the enforcing agency.

For buildings and structures with an occupancy in Group H, separate floor plans shall be submitted identifying the locations of anticipated contents and processes so as to reflect the nature of each occupied portion of every building and structure.

4.14.2 Control areas.
Control areas shall comply with Clauses 4.14.2.1 through 4.14.2.5 and the Ghana Fire Code.

Exception: Higher education laboratories in accordance with Clause 4.28 and Part 38 of the Ghana Fire Code.

4.14.2.1 Construction requirements.
Control areas shall be separated from each other by fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

4.14.2.2 Percentage of maximum allowable quantities.
The percentage of maximum allowable quantities of hazardous materials per control area permitted at each floor level within a building shall be in accordance with Table 4.14.2.2.

<table>

NOTE:
4.14.2.3 Number.
The maximum number of control areas within a building shall be in accordance with Table 4.14.2.2.

4.14.2.4 Fire-resistance rating requirements.
The required fire-resistance rating for fire barriers shall be in accordance with Table 4.14.2.2. The floor assembly of the control area and the construction supporting the floor of the control area shall have a fire-resistance rating of not less than 2 hours.

**Exception:** The floor assembly of the control area and the construction supporting the floor of the control area are allowed to be 1-hour fire-resistance-rated in buildings of Types IA, IIA and III construction, provided that both of the following conditions exist:

1. The building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.
2. The building is three or fewer stories above grade plane.

4.14.2.5 Hazardous material in Group M display and storage areas and in Group S storage areas.
Hazardous materials located in Group M and Group S occupancies shall be in accordance with Clauses 4.14.2.5.1 through 4.14.2.5.3.

[F] TABLE 4.14.2.5(1)
MAXIMUM ALLOWABLE QUANTITY PER INDOOR AND OUTDOOR CONTROL AREA IN GROUP M AND S OCCUPANCIES NONFLAMMABLE SOLIDS AND NONFLAMMABLE AND NONCOMBUSTIBLE LIQUIDS
d, e, f

<table>
<thead>
<tr>
<th>CONDITION</th>
<th>MAXIMUM ALLOWABLE</th>
</tr>
</thead>
</table>

a. Percentages shall be of the maximum allowable quantity per control area shown in Tables 3.7.1(1) and 3.7.1(2), with all increases allowed in the notes to those tables.
b. Separation shall include fire barriers and horizontal assemblies as necessary to provide separation from other portions of the building.
4.14.2.5.1 Nonflammable solids and nonflammable and noncombustible liquids.

The aggregate quantity of nonflammable solid and nonflammable or noncombustible liquid hazardous materials permitted within a single control area of a Group M display and storage area, a Group S storage area or an outdoor control area is permitted to exceed the maximum allowable quantities per control area specified in Tables 3.7.1(1) and 3.7.1(2) without classifying the building or use as a Group H occupancy, provided that the materials are displayed and stored in accordance with the Ghana Fire Code and quantities do not exceed the maximum allowable specified in Table 4.14.2.5(1).

4.14.2.5.2 Flammable and combustible liquids.

In Group M occupancy wholesale and retail sales uses, indoor storage of flammable and combustible liquids shall not exceed the maximum allowable quantities per control area as indicated in Table 4.14.2.5(2), provided that the materials are displayed and stored in accordance with the Ghana Fire Code.

4.14.2.5.3 Aerosol products.

The maximum quantity of aerosol products in Group M occupancy retail display areas, storage areas adjacent to retail display areas and retail storage areas shall be in accordance with the Ghana Fire Code.

Rooms, areas or spaces in which explosive, corrosive, combustible, flammable or highly toxic dusts, mists, fumes, vapours or gases are or have the potential to be emitted due to the processing, use, handling or storage of materials shall be mechanically ventilated where required by this Code and the Ghana Fire Code.

b. See the Ghana Fire Code.
c. As generated during manufacturing or processing.
d. Storage or use.
e. In open use or dispensing.
f. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.
g. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.
h. Explosion venting is not required for Group H-5 fabrication areas complying with Clause 4.15.11.1 and the Ghana Fire Code.
4.14.5.2 Emergency or standby power.
Where required by the Ghana Fire Code or this Code, mechanical ventilation, treatment systems, temperature control, alarm, detection or other electrically operated systems shall be provided with emergency or standby power in accordance with Clause 28.13. For storage and use areas for highly toxic or toxic materials, see Clauses 6004.2.2.8 and 6004.3.4.2 of the Ghana Fire Code.

4.14.5.2.1 Exempt applications.
Emergency or standby power is not required for the mechanical ventilation systems provided for any of the following:

1. Storage of Class IB and IC flammable and combustible liquids in closed containers not exceeding 25 L (6.5 gallons) capacity.
2. Storage of Class 1 and 2 oxidizers.
4. Storage of asphyxiant, irritant and radioactive gases.

4.14.5.2.2 Fail-safe engineered systems.
Standby power for mechanical ventilation, treatment systems and temperature control systems shall not be required where an approved fail-safe engineered system is installed.

4.14.5.3 Spill control, drainage and containment.
Rooms, buildings or areas occupied for the storage of solid and liquid hazardous materials shall be provided with a means to control spillage and to contain or drain off spillage and fire protection water discharged in the storage area where required in the Ghana Fire Code. The methods of spill control shall be in accordance with the Ghana Fire Code.

4.14.6 Outdoor storage, dispensing and use.
The outdoor storage, dispensing and use of hazardous materials shall be in accordance with the Ghana Fire Code.

Where weather protection is provided for sheltering outdoor hazardous material storage or use areas, such areas shall be considered outdoor storage or use where the weather protection structure complies with Clauses 4.14.6.1.1 through 4.14.6.1.3.

4.14.6.1.1 Walls.
Walls shall not obstruct more than one side of the structure.

Exception: Walls shall be permitted to obstruct portions of multiple sides of the structure, provided that the obstructed area is not greater than 25 percent of the structure’s perimeter.

4.14.6.1.2 Separation distance.
The distance from the structure to buildings, plot lines, public ways or means of escape to a public way shall be not less than the distance required for an outside hazardous material storage or use area without weather protection.

4.14.6.1.3 Noncombustible construction.
The overhead structure shall be of approved noncombustible construction with a maximum area of 140 m² (1,500 square feet).

Exception: The maximum area is permitted to be increased as provided by Clause 6.9.

4.15 GROUPS H-1, H-2, H-3, H-4 AND H-5

4.15.1 General.
The provisions of Clauses 4.15.1 through 4.15.11 shall apply to the storage and use of hazardous materials in excess of the maximum allowable quantities per control area listed in this Code.

4.15.2 Compliance.
Buildings and structures with an occupancy in Group H shall comply with the applicable provisions of Clause 4.14 and the Ghana Fire Code.

4.15.3 Automatic fire detection systems.
Group H occupancies shall be provided with an automatic fire detection system in accordance with Clause 10.7.2.
4.15.4 Automatic sprinkler system.
Group H occupancies shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.2.5.

4.15.5 Emergency alarms.
Emergency alarms for the detection and notification of an emergency condition in Group H occupancies shall be provided as set forth herein.

4.15.5.1 Storage.
An approved manual emergency alarm system shall be provided in buildings, rooms or areas used for storage of hazardous materials. Emergency alarm-initiating devices shall be installed outside of each interior exit or exit access door of storage buildings, rooms or areas. Activation of an emergency alarm-initiating device shall sound a local alarm to alert occupants of an emergency situation involving hazardous materials.

4.15.5.2 Dispensing, use and handling.
Where hazardous materials having a hazard ranking of 3 or 4 in accordance with the Ghana Fire Code are transported through corridors, interior exit stairways or ramps, or exit passageways, there shall be an emergency telephone system, a local manual alarm station or an approved alarm-initiating device at not more than 45 720 mm (150-foot) intervals and at each exit and exit access doorway throughout the transport route. The signal shall be relayed to an approved central, proprietary or remote station service or constantly attended on-site location and shall initiate a local audible alarm.

4.15.5.3 Supervision.
Emergency alarm systems required by Clause 4.15.5.1 or 4.15.5.2 shall be electrically supervised and monitored by an approved central, proprietary or remote station service or shall initiate an audible and visual signal at a constantly attended on-site location.

4.15.5.4 Emergency alarm systems.
Emergency alarm systems required by Clause 4.15.5.1 or 4.15.5.2 shall be provided with emergency or standby power in accordance with Clause 28.13.2.

4.15.6 Fire separation distance.
Group H occupancies shall be located on property in accordance with the other provisions of this part. In Groups H-2 and H-3, not less than 25 percent of the perimeter wall of the occupancy shall be an exterior wall.

Exceptions:

1. Liquid use, dispensing and mixing rooms having a floor area of not more than 46.5 m$^2$ (500 square feet) need not be located on the outer perimeter of the building where they are in accordance with the Ghana Fire Code.

2. Liquid storage rooms having a floor area of not more than 93 m$^2$ (1,000 square feet) need not be located on the outer perimeter where they are in accordance with the Ghana Fire Code.

3. Spray paint booths that comply with the Ghana Fire Code need not be located on the outer perimeter.

4.15.6.1 Group H occupancy minimum fire separation distance.
Regardless of any other provisions, buildings containing Group H occupancies shall be set back to the minimum fire separation distance as set forth in Clauses 4.15.6.1.1 through 4.15.6.1.4. Distances shall be measured from the walls enclosing the occupancy to plot lines, including those on a public way. Distances to assumed plot lines established for the purpose of determining exterior wall and opening protection are not to be used to establish the minimum fire separation distance for buildings on sites where explosives are manufactured or used where separation is provided in accordance with the quantity distance tables specified for explosive materials in the Ghana Fire Code.

4.15.6.1.1 Group H-1.
Group H-1 occupancies shall be set back not less than 22 860 mm (75 feet) and not less than required by the Ghana Fire Code.

Exception: Fireworks manufacturing buildings separated in accordance with the Ghana Fire Code.
### 4.15.6.2 Group H-2.
Group H-2 occupancies shall be set back not less than 9144 mm (30 feet) where the area of the occupancy is greater than 93 m² (1,000 square feet) and it is not required to be located in a detached building.

### 4.15.6.3 Groups H-2 and H-3.
Group H-2 and H-3 occupancies shall be set back not less than 15 240 mm (50 feet) where a detached building is required (see Table 4.15.6.2).

### 4.15.6.4 Explosive materials.
Group H-2 and H-3 occupancies containing materials with explosive characteristics shall be separated as required by the Ghana Fire Code. Where separations are not specified, the distances required shall be determined by a technical report issued in accordance with Clause 4.14.1.3.

### 4.15.6.2 Detached buildings for Group H-1, H-2 or H-3 occupancy.
The storage or use of hazardous materials in excess of those amounts listed in Table 4.15.6.2 shall be in accordance with the applicable provisions of Clauses 4.15.7 and 4.15.8.

</table>

For SI: 1 ton = 906 kg, 1 cubic foot = 0.02832 m³, 1 pound = 0.454 kg.

a. For materials that are detonable, the distance to other buildings or plot lines shall be in accordance with Clause 4.15.6 of this Code or the Ghana Fire Code based on trinitrotoluene (TNT) equivalence of the material, whichever is greater.
b. Maximum Allowable Quantity means the maximum allowable quantity per control area set forth in Table 3.7.1(1).
c. Limited to Division 1.4 materials and articles, including packaged for shipment, that are not regulated as an explosive under Bureau of Alcohol, Tobacco, Firearms and Explosives (BATF) regulations or unpackaged articles used in process operations that do not propagate a detonation or deflagration between articles, provided that the net explosive weight of individual articles does not exceed 1 pound.

### 4.15.6.2.1 Wall and opening protection.
Where a detached building is required by Table 4.15.6.2, wall and opening protection based on fire separation distance is not required.

### 4.15.7 Special provisions for Group H-1 occupancies.
Group H-1 occupancies shall be in detached buildings not used for other purposes. Roofs shall be of lightweight construction with suitable
thermal insulation to prevent sensitive material from reaching its decomposition temperature. Group H-1 occupancies containing materials that are in themselves both physical and health hazards in quantities exceeding the maximum allowable quantities per control area in Table 3.7.1(2) shall comply with requirements for both Group H-1 and H-4 occupancies.

4.15.7.1 Floors in storage rooms.
Floors in storage areas for organic peroxides, pyrophoric materials and unstable (reactive) materials shall be of liquid-tight, noncombustible construction.

4.15.8 Special provisions for Group H-2 and H-3 occupancies.
Group H-2 and H-3 occupancies containing quantities of hazardous materials in excess of those set forth in Table 4.15.6.2 shall be in detached buildings used for manufacturing, processing, dispensing, use or storage of hazardous materials. Materials listed for Group H-1 occupancies in Clause 3.7.3 are permitted to be located within Group H-2 or H-3 detached buildings provided that the amount of materials per control area do not exceed the maximum allowed quantity specified in Table 3.7.1(1).

4.15.8.1 Multiple hazards.
Group H-2 or H-3 occupancies containing materials that are in themselves both physical and health hazards in quantities exceeding the maximum allowable quantities per control area in Table 3.7.1(2) shall comply with requirements for Group H-2, H-3 or H-4 occupancies as applicable.

4.15.8.2 Separation of incompatible materials.
Hazardous materials other than those listed in Table 4.15.6.2 shall be allowed in manufacturing, processing, dispensing, use or storage areas when separated from incompatible materials in accordance with the provisions of the Ghana Fire Code.

4.15.8.3 Water reactives.
Group H-2 and H-3 occupancies containing water-reactive materials shall be resistant to water penetration. Piping for conveying liquids shall not be over or through areas containing water reactives, unless isolated by approved liquid-tight construction.

Exception: Fire protection piping shall be permitted over or through areas containing water reactives without isolating it with liquid-tight construction.

4.15.8.4 Floors in storage rooms.
Floors in storage areas for organic peroxides, oxidizers, pyrophoric materials, unstable (reactive) materials and water-reactive solids and liquids shall be of liquid-tight, noncombustible construction.

4.15.8.5 Waterproof room.
Rooms or areas used for the storage of water-reactive solids and liquids shall be constructed in a manner that resists the penetration of water through the use of waterproof materials. Piping carrying water for other than approved automatic sprinkler systems shall not be within such rooms or areas.

4.15.9 Group H-2.
Occupancies in Group H-2 shall be constructed in accordance with Clauses 4.15.9.1 through 4.15.9.3 and the Ghana Fire Code.

4.15.9.1 Flammable and combustible liquids.
The storage, handling, processing and transporting of flammable and combustible liquids in Group H-2 and H-3 occupancies shall be in accordance with Clauses 4.15.9.1.1 through 4.15.9.1.9 and the Ghana Fire Code.

4.15.9.1.1 Mixed occupancies.
Where the storage tank area is located in a building of two or more occupancies and the quantity of liquid exceeds the maximum allowable quantity for one control area, the use shall be completely separated from adjacent occupancies in accordance with the requirements of Clause 6.11.4.

4.15.9.1.1 Height exception.
Where storage tanks are located within a building not more than one storey above grade plane, the height limitation of Clause 6.4 shall not apply for Group H.
4.15.9.1.2 Tank protection.

Storage tanks shall be noncombustible and protected from physical damage. Fire barriers or horizontal assemblies or both around the storage tanks shall be permitted as the method of protection from physical damage.

4.15.9.1.3 Tanks.

Storage tanks shall be approved tanks conforming to the requirements of the Ghana Fire Code.

4.15.9.1.4 Leakage containment.

A liquid-tight containment area compatible with the stored liquid shall be provided. The method of spill control, drainage control and secondary containment shall be in accordance with the Ghana Fire Code.

Exception: Rooms where only double-wall storage tanks conforming to Clause 4.15.9.1.3 are used to store Class I, II and IIIA flammable and combustible liquids shall not be required to have a leakage containment area.

4.15.9.1.5 Leakage alarm.

An approved automatic alarm shall be provided to indicate a leak in a storage tank and room. The alarm shall sound an audible signal, 15 dBA above the ambient sound level, at every point of entry into the room in which the leaking storage tank is located. An approved sign shall be posted on every entry door to the tank storage room indicating the potential hazard of the interior room environment, or the sign shall state: WARNING, WHEN ALARM SOUNDS, THE ENVIRONMENT WITHIN THE ROOM MAY BE HAZARDOUS. The leakage alarm shall be supervised in accordance with Part 10 to transmit a trouble signal.

4.15.9.1.6 Tank vent.

Storage tank vents for Class I, II or IIIA liquids shall terminate to the outdoor air in accordance with the Ghana Fire Code.

4.15.9.1.7 Room ventilation.

Storage tank areas storing Class I, II or IIIA liquids shall be provided with mechanical ventilation. The mechanical ventilation system shall be in accordance with the International Mechanical Code and the Ghana Fire Code.

4.15.9.1.8 Explosion venting.

Where Class I liquids are being stored, explosion venting shall be provided in accordance with the Ghana Fire Code.

4.15.9.1.9 Tank openings other than vents.

Tank openings other than vents from tanks inside buildings shall be designed to ensure that liquids or vapour concentrations are not released inside the building.

4.15.9.2 Liquefied petroleum gas facilities.

The construction and installation of liquefied petroleum gas facilities shall be in accordance with the requirements of this Code and the Ghana Fire Code.

4.15.9.3 Dry cleaning plants.

The construction and installation of dry cleaning plants shall be in accordance with the requirements of this Code. Dry cleaning solvents and systems shall be classified in accordance with the Ghana Fire Code.

4.15.10 Groups H-3 and H-4.

Groups H-3 and H-4 shall be constructed in accordance with the applicable provisions of this Code and the Ghana Fire Code.

4.15.10.1 Flammable and combustible liquids.

The storage, handling, processing and transporting of flammable and combustible liquids in Group H-3 occupancies shall be in accordance with Clause 4.15.9.1.

4.15.10.2 Gas rooms.

Where gas rooms are provided, such rooms shall be separated from other areas by not less than 1-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

4.15.10.3 Floors in storage rooms.

Floors in storage areas for corrosive liquids and highly toxic or toxic materials shall be of liquid-tight, noncombustible construction.

4.15.10.4 Separation of highly toxic solids and liquids.

Highly toxic solids and liquids not stored in approved hazardous materials storage cabinets shall be isolated from other hazardous materials.
materials storage by not less than 1-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

4.15.11 Group H-5.
In addition to the requirements set forth elsewhere in this Code, Group H-5 shall comply with the provisions of Clauses 4.15.11.1 through 4.15.11.11 and the Ghana Fire Code.

4.15.11.1 Fabrication areas.
Fabrication areas shall comply with Clauses 4.15.11.1.1 through 4.15.11.1.8.

4.15.11.1.1 Hazardous materials.
Hazardous materials and hazardous production materials (HPM) shall comply with Clauses 4.15.11.1.1.1 and 4.15.11.1.1.2.

4.15.11.1.1.1 Aggregate quantities.
The aggregate quantities of hazardous materials stored and used in a single fabrication area shall not exceed the quantities set forth in Table 4.15.11.1.1.1.

Exception: The quantity limitations for any hazard category in Table 4.15.11.1.1.1 shall not apply where the fabrication area contains quantities of hazardous materials not exceeding the maximum allowable quantities per control area established by Tables 3.7.1(1) and 3.7.1(2).

Notes:
- Note a: Not LIMTED
- Note b: Not Applicable
- Note c: Calculated
- Note d: See Table 4.15.11.1.1.1
4.15.11.1.2 Hazardous production materials.

The maximum quantities of hazardous production materials (HPM) stored in a single fabrication area shall not exceed the maximum allowable quantities per control area established by Tables 3.7.1(1) and 3.7.1(2).

4.15.11.1.4 Floors.

Except for surfacing, floors within fabrication areas shall be of noncombustible construction.

Openings through floors of fabrication areas are permitted to be unprotected where the interconnected levels are used solely for mechanical equipment directly related to such fabrication areas (see Clause 4.15.11.1.5).

Floors forming a part of an occupancy separation shall be liquid tight.

4.15.11.1.5 Shafts and openings through floors.

Elevator hoistways, vent shafts and other openings through floors shall be enclosed where required by Clause 8.12 and Clause 8.13. Mechanical, duct and piping penetrations within a fabrication area shall not extend through more than two floors. The annular space around penetrations for cables, cable trays, tubing, piping, conduit or ducts shall be sealed at the floor level to restrict the movement of air. The fabrication area, including the areas through which the ductwork and piping extend, shall be considered to be a single conditioned environment.

4.15.11.1.6 Ventilation.

Mechanical exhaust ventilation at the rate of not less than 1 cubic foot per minute per square foot of floor area shall be provided throughout the portions of the fabrication area where HPM are used or stored. The exhaust air duct system of one fabrication area shall not connect to another duct system outside that fabrication area within the building.

A ventilation system shall be provided to capture and exhaust gases, fumes and vapours at workstations.

Two or more operations at a workstation shall not be connected to the same exhaust system where either one or the combination of the substances removed could constitute a fire, explosion or hazardous chemical reaction within the exhaust duct system.

Exhaust ducts penetrating fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, shall be contained in a shaft of equivalent fire-
resistance-rated construction. Exhaust ducts shall not penetrate fire walls.

Fire dampers shall not be installed in exhaust ducts.

4.15.11.1.7 Transporting hazardous production materials to fabrication areas.

HPM shall be transported to fabrication areas through enclosed piping or tubing systems that comply with Clause 4.15.11.6, through service corridors complying with Clause 4.15.11.3, or in corridors as permitted in the exception to Clause 4.15.11.2. The handling or transporting of HPM within service corridors shall comply with the Ghana Fire Code.

4.15.11.1.8 Electrical.

Electrical equipment and devices within the fabrication area shall comply with Ghana Wiring Code. The requirements for hazardous locations need not be applied where the average air change is not less than four times that set forth in Clause 4.15.11.1.6 and where the number of air changes at any location is not less than three times that required by Clause 4.15.11.1.6. The use of recirculated air shall be permitted.

4.15.11.8.1 Workstations.

Workstations shall not be energized without adequate exhaust ventilation. See Clause 4.15.11.1.6 for workstation exhaust ventilation requirements.

4.15.11.2 Corridors.

Corridors shall comply with Part 11 and shall be separated from fabrication areas as specified in Clause 4.15.11.1.2. Corridors shall not contain HPM and shall not be used for transporting such materials except through closed piping systems as provided in Clause 4.15.11.6.4.

Exception: Where existing fabrication areas are altered or modified, HPM is allowed to be transported in existing corridors, subject to the following conditions:

1. Nonproduction HPM is allowed to be transported in corridors if utilized for maintenance, lab work and testing.

2. Where existing fabrication areas are altered or modified, HPM is allowed to be transported in existing corridors, subject to the following conditions:

   2.1. Corridors. Corridors adjacent to the fabrication area where the alteration work is to be done shall comply with Clause 11.20 for a length determined as follows:

   2.1.1. The length of the common wall of the corridor and the fabrication area; and

   2.1.2. For the distance along the corridor to the point of entry of HPM into the corridor serving that fabrication area.

2.2. Emergency alarm system. There shall be an emergency telephone system, a local manual alarm station or other approved alarm-initiating device within corridors at not more than 45 720 mm (150-foot) intervals and at each exit and doorway. The signal shall be relayed to an approved central, proprietary or remote station service or the emergency control station and shall initiate a local audible alarm.

2.3. Pass-throughs. Self-closing doors having a fire protection rating of not less than 1 hour shall separate pass-throughs from existing corridors. Pass-throughs shall be constructed as required for the corridors and protected by an approved automatic sprinkler system.

4.15.11.3 Service corridors.

Service corridors within a Group H-5 occupancy shall comply with Clauses 4.15.11.3.1 through 4.15.11.3.4.

4.15.11.3.1 Use conditions.

Service corridors shall be separated from corridors as required by Clause 4.15.11.1.2. Service corridors shall not be used as a required corridor.

4.15.11.3.2 Mechanical ventilation.

Service corridors shall be mechanically ventilated as required by Clause 4.15.11.1.6 or at not less than six air changes per hour.

4.15.11.3.3 Means of escape.

The distance of travel from any point in a service corridor to an exit, exit access corridor or door into a fabrication area shall be not
greater than 22 860 mm (75 feet). Dead ends shall be not greater than 4 feet (1219 mm) in length. There shall be not less than two exits, and not more than one-half of the required means of escape shall require travel into a fabrication area. Doors from service corridors shall swing in the direction of escape travel and shall be self-closing.

4.15.11.3.4 Minimum width.
The clear width of a service corridor shall be not less than 1524 mm (5 feet), or 838 mm (33 inches) wider than the widest cart or truck used in the service corridor, whichever is greater.

4.15.11.3.5 Emergency alarm system.
Emergency alarm systems shall be provided in accordance with this clause and Clauses 4.15.5.1 and 4.15.5.2. The maximum allowable quantity per control area provisions shall not apply to emergency alarm systems required for HPM.

4.15.11.3.5.1 Service corridors.
An emergency alarm system shall be provided in service corridors, with not less than one alarm device in each service corridor.

4.15.11.3.5.2 Corridors and interior exit stairways and ramps.
Emergency alarms for corridors, interior exit stairways and ramps and exit passageways shall comply with Clause 4.15.5.2.

4.15.11.3.5.3 Liquid storage rooms, HPM rooms and gas rooms.
Emergency alarms for liquid storage rooms, HPM rooms and gas rooms shall comply with Clause 415.5.1.

4.15.11.3.5.4 Alarm-initiating devices.
An approved emergency telephone system, local alarm manual pull stations, or other approved alarm-initiating devices are allowed to be used as emergency alarm-initiating devices.

4.15.11.3.5.5 Alarm signals.
Activation of the emergency alarm system shall sound a local alarm and transmit a signal to the emergency control station.

4.15.11.4 Storage of hazardous production materials.
Storage of hazardous production materials (HPM) in fabrication areas shall be within approved or listed storage cabinets or gas cabinets or within a workstation. The storage of HPM in quantities greater than those listed in the Ghana Fire Code shall be in liquid storage rooms, HPM rooms or gas rooms as appropriate for the materials stored. The storage of other hazardous materials shall be in accordance with other applicable provisions of this Code and the Ghana Fire Code.

4.15.11.5 HPM rooms, gas rooms, liquid storage room construction.
HPM rooms, gas rooms and liquid shall be constructed in accordance with Clauses 4.15.11.5.1 through 4.15.11.5.9.

4.15.11.5.1 HPM rooms and gas rooms.
HPM rooms and gas rooms shall be separated from other areas by fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. The fire-resistance rating shall be not less than 2 hours where the area is 27.9 m² (300 square feet) or more and not less than 1 hour where the area is less than 27.9 m² (300 square feet).

4.15.11.5.2 Liquid storage rooms.
Liquid storage rooms shall be constructed in accordance with the following requirements:

1. Rooms greater than 46.5 m² (500 square feet) in area, shall have not less than one exterior door approved for fire department access.

2. Rooms shall be separated from other areas by fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. The fire-resistance rating shall be not less than 1 hour for rooms up to 13.9 m² (150 square feet) in area and not less than 2 hours where the room is more than 13.9 m² (150 square feet) in area.

3. Shelving, racks and wainscoting in such areas shall be of noncombustible construction or wood of not less than 25 mm (1-inch) nominal thickness or fire-
4. Rooms used for the storage of Class I flammable liquids shall not be located in a basement.

4.15.11.5.3 Floors.
Except for surfacing, floors of HPM rooms and liquid storage rooms shall be of noncombustible liquid-tight construction. Raised grating over floors shall be of noncombustible materials.

4.15.11.5.4 Location.
Where HPM rooms, liquid storage rooms and gas rooms are provided, they shall have not less than one exterior wall and such wall shall be not less than 9144 mm (30 feet) from plot lines, including plot lines adjacent to public ways.

4.15.11.5.5 Explosion control.
Explosion control shall be provided where required by Clause 4.14.5.1.

4.15.11.5.6 Exits.
Where two exits are required from HPM rooms, liquid storage rooms and gas rooms, one shall be directly to the outside of the building.

4.15.11.5.7 Doors.
Doors in a fire barrier wall, including doors to corridors, shall be self-closing fire door assemblies having a fire protection rating of not less than 3 1/4 hour.

4.15.11.5.8 Ventilation.
Mechanical exhaust ventilation shall be provided in liquid storage rooms, HPM rooms and gas rooms at the rate of not less than 0.044 L/s/m² (1 cubic foot per minute per square foot) of floor area or six air changes per hour.

Exhaust ventilation for gas rooms shall be designed to operate at a negative pressure in relation to the surrounding areas and direct the exhaust ventilation to an exhaust system.

4.15.11.5.9 Emergency alarm system.
An approved emergency alarm system shall be provided for HPM rooms, liquid storage rooms and gas rooms.

Emergency alarm-initiating devices shall be installed outside of each interior exit door of such rooms.

Activation of an emergency alarm-initiating device shall sound a local alarm and transmit a signal to the emergency control station.

An approved emergency telephone system, local alarm manual pull stations or other approved alarm-initiating devices are allowed to be used as emergency alarm-initiating devices.

4.15.11.6 Piping and tubing.
Hazardous production materials piping and tubing shall comply with this clause and ASME B31.3.

4.15.11.6.1 HPM having a health-hazard ranking of 3 or 4.
Systems supplying HPM liquids or gases having a health-hazard ranking of 3 or 4 shall be welded throughout, except for connections, to the systems that are within a ventilated enclosure if the material is a gas, or an approved method of drainage or containment is provided for the connections if the material is a liquid.

4.15.11.6.2 Location in service corridors.
Hazardous production materials supply piping or tubing in service corridors shall be exposed to view.

4.15.11.6.3 Excess flow control.
Where HPM gases or liquids are carried in pressurized piping above 103.4 kPa (15 pounds per square inch gauge (psig)), excess flow control shall be provided. Where the piping originates from within a liquid storage room, HPM room or gas room, the excess flow control shall be located within the liquid storage room, HPM room or gas room. Where the piping originates from a bulk source, the excess flow control shall be located as close to the bulk source as practical.

4.15.11.6.4 Installations in corridors and above other occupancies.
The installation of HPM piping and tubing within the space defined by the walls of corridors and the floor or roof above, or in concealed spaces above other occupancies, shall be in accordance with Clauses 4.15.11.6.1 through 4.15.11.6.3 and the following conditions:
1. Automatic sprinklers shall be installed within the space unless the space is less than 152 mm (6 inches) in the least dimension.

2. Ventilation not less than six air changes per hour shall be provided. The space shall not be used to convey air from any other area.

3. Where the piping or tubing is used to transport HPM liquids, a receptor shall be installed below such piping or tubing. The receptor shall be designed to collect any discharge or leakage and drain it to an approved location. The 1-hour enclosure shall not be used as part of the receptor.

4. HPM supply piping and tubing and nonmetallic waste lines shall be separated from the corridor and from occupancies other than Group H-5 by fire barriers or by an approved method or assembly that has a fire-resistance rating of not less than 1 hour. Access openings into the enclosure shall be protected by approved fire-protection-rated assemblies.

5. Readily accessible manual or automatic remotely activated fail-safe emergency shutoff valves shall be installed on piping and tubing other than waste lines at the following locations:

   5.1. At branch connections into the fabrication area.

   5.2. At entries into corridors.

**Exception:** Transverse crossings of the corridors by supply piping that is enclosed within a ferrous pipe or tube for the width of the corridor need not comply with Items 1 through 5.

4.15.11.6.5 Identification.
Piping, tubing and HPM waste lines shall be identified in accordance with ANSI A13.1 to indicate the material being transported.

4.15.11.7 Gas detection systems.
A gas detection system complying with Clause 916 shall be provided for HPM gases where the physiological warning threshold level of the gas is at a higher level than the accepted permissible exposure limit (PEL) for the gas and for flammable gases in accordance with Clauses 4.15.11.7.1 through 4.15.11.7.2.

4.15.11.7.1 Where required.
A gas detection system shall be provided in the areas identified in Clauses 4.15.11.7.1.1 through 4.15.11.7.1.4.

4.15.11.7.1.1 Fabrication areas.
A gas detection system shall be provided in fabrication areas where HPM gas is used in the fabrication area.

4.15.11.7.1.2 HPM rooms.
A continuous gas detection system shall be provided in HPM rooms where HPM gas is used in the room.

4.15.11.7.1.3 Gas cabinets, exhausted enclosures and gas rooms.
A gas detection system shall be provided in gas cabinets and exhausted enclosures for HPM gas. A gas detection system shall be provided in gas rooms where HPM gases are not located in gas cabinets or exhausted enclosures.

4.15.11.7.1.4 Corridors.
Where HPM gases are transported in piping placed within the space defined by the walls of a corridor and the floor or roof above the corridor, a gas detection system shall be provided where piping is located and in the corridor.

**Exception:** A gas detection system is not required for occasional transverse crossings of the corridors by supply piping that is enclosed in a ferrous pipe or tube for the width of the corridor.

4.15.11.7.2 Gas detection system operation.
The gas detection system shall be capable of monitoring the room, area or equipment in which the HPM gas is located at or below all the following gas concentrations:

1. Immediately dangerous to life and health (IDLH) values where the monitoring point is within an exhausted enclosure, ventilated enclosure or gas cabinet.

2. Permissible exposure limit (PEL) levels where the monitoring point is in an area outside an exhausted enclosure, ventilated enclosure or gas cabinet.
3. For flammable gases, the monitoring detection threshold level shall be vapour concentrations in excess of 25 percent of the lower flammable limit (LFL) where the monitoring is within or outside an exhausted enclosure, ventilated enclosure or gas cabinet.

4. Except as noted in this clause, monitoring for highly toxic and toxic gases shall also comply with the Ghana Fire Code

4.15.11.7.2.1 Alarms.

The gas detection system shall initiate a local alarm and transmit a signal to the emergency control station when a short-term hazard condition is detected. The alarm shall be both visual and audible and shall provide warning both inside and outside the area where the gas is detected. The audible alarm shall be distinct from all other alarms.

4.15.11.7.2.2 Shutoff of gas supply.

The gas detection system shall automatically close the shutoff valve at the source on gas supply piping and tubing related to the system being monitored for which gas is detected when a short-term hazard condition is detected. Automatic closure of shutoff valves shall comply with the following:

1. Where the gas detection sampling point initiating the gas detection system alarm is within a gas cabinet or exhausted enclosure, the shutoff valve in the gas cabinet or exhausted enclosure for the specific gas detected shall automatically close.

2. Where the gas detection sampling point initiating the gas detection system alarm is within a room and compressed gas containers are not in gas cabinets or an exhausted enclosure, the shutoff valves on all gas lines for the specific gas detected shall automatically close.

3. Where the gas detection sampling point initiating the gas detection system alarm is within a piping distribution manifold enclosure, the shutoff valve supplying the manifold for the compressed gas container of the specific gas detected shall automatically close.

Exception: Where the gas detection sampling point initiating the gas detection system alarm is at the use location or within a gas valve enclosure of a branch line downstream of a piping distribution manifold, the shutoff valve for the branch line located in the piping distribution manifold enclosure shall automatically close.

4.15.11.8 Manual fire alarm system.

An approved manual fire alarm system shall be provided throughout buildings containing Group H-5. Activation of the alarm system shall initiate a local alarm and transmit a signal to the emergency control station. The fire alarm system shall be designed and installed in accordance with Clause 10.7.

4.15.11.9 Emergency control station.

An emergency control station shall be provided in accordance with Clauses 4.15.11.9.1 through 4.15.11.9.3.

4.15.11.9.1 Location.

The emergency control station shall be located on the premises at an approved location outside the fabrication area.

4.15.11.9.2 Staffing.

Trained personnel shall continuously staff the emergency control station.

4.15.11.9.3 Signals.

The emergency control station shall receive signals from emergency equipment and alarm and detection systems. Such emergency equipment and alarm and detection systems shall include, but not be limited to, the following where such equipment or systems are required to be provided either in this part or elsewhere in this Code:

1. Automatic sprinkler system alarm and monitoring systems.

3. Emergency alarm systems.

4. Gas detection systems.

5. Smoke detection systems.

6. Emergency power system.

7. Automatic detection and alarm systems for pyrophoric liquids and
Class 3 water-reactive liquids required in the Ghana Fire Code.

4.15.11.10 Emergency power system.

An emergency power system shall be provided in Group H-5 occupancies in accordance with Clause 28.13. The emergency power system shall supply power automatically to the electrical systems specified in Clause 4.15.11.10.1 when the normal electrical supply system is interrupted.

4.15.11.10.1 Required electrical systems.

Emergency power shall be provided for electrically operated equipment and connected control circuits for the following systems:

1. HPM exhaust ventilation systems.
2. HPM gas cabinet ventilation systems.
3. HPM exhausted enclosure ventilation systems.
4. HPM gas room ventilation systems.
5. HPM gas detection systems.
7. Automatic sprinkler system monitoring and alarm systems.
11. Electrically operated systems required elsewhere in this Code or in the Ghana Fire Code applicable to the use, storage or handling of HPM.

4.15.11.10.2 Exhaust ventilation systems.

Exhaust ventilation systems are allowed to be designed to operate at not less than one-half the normal fan speed on the emergency power system where it is demonstrated that the level of exhaust will maintain a safe atmosphere.

4.15.11.11 Automatic sprinkler system protection in exhaust ducts for HPM.

An approved automatic sprinkler system shall be provided in exhaust ducts conveying gases, vapours, fumes, mists or dusts generated from HPM in accordance with Clauses 4.15.11.11.1 through 415.11.11.3 and the International Mechanical Code.

4.15.11.11.1 Metallic and noncombustible nonmetallic exhaust ducts.

An approved automatic sprinkler system shall be provided in metallic and noncombustible nonmetallic exhaust ducts where all of the following conditions apply:

1. Where the largest cross-clauseal diameter is equal to or greater than 254 mm (10 inches).
2. The ducts are within the building.
3. The ducts are conveying flammable gases, vapours or fumes.

4.15.11.11.2 Combustible nonmetallic exhaust ducts.

Automatic sprinkler system protection shall be provided in combustible nonmetallic exhaust ducts where the largest cross-clauseal diameter of the duct is equal to or greater than 254 mm (10 inches).

Exception: Ducts need not be provided with automatic sprinkler protection as follows:

1. Ducts listed or approved for applications without automatic sprinkler system protection.
2. Ducts not more than 3658 mm (12 feet) in length installed below ceiling level.
4.15.11.3 Automatic sprinkler locations.
Sprinkler systems shall be installed at 3658 mm (12-foot) intervals in horizontal ducts and at changes in direction. In vertical ducts, sprinklers shall be installed at the top and at alternate floor levels.

4.16 SPRAY APPLICATION OF FLAMMABLE FINISHES

4.16.1 General.
The provisions of this clause shall apply to the construction, installation and use of buildings and structures, or parts thereof, for the spray application of flammable finishes. Operations and equipment shall comply with the Ghana Fire Code.

4.16.2 Spray rooms.
Spray rooms shall be enclosed with not less than 1-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11), or both. Floors shall be waterproofed and drained in an approved manner.

4.16.2.1 Construction.
Walls and ceilings of spray rooms shall be constructed of noncombustible materials or the interior surface shall be completely covered with noncombustible materials. Aluminum shall not be used.

4.16.2.2 Surfaces.
The interior surfaces of spray rooms shall be smooth and shall be so constructed to permit the free passage of exhaust air from all parts of the interior and to facilitate washing and cleaning, and shall be so designed to confine residues within the room.

4.16.3 Spraying spaces.
Spraying spaces shall be ventilated with an exhaust system to prevent the accumulation of flammable mist or vapours in accordance with this Code. Where such spaces are not separately enclosed, noncombustible spray curtains shall be provided to restrict the spread of flammable vapours.

4.16.3.1 Surfaces.
The interior surfaces of spraying spaces shall be smooth; shall be so constructed to permit the free passage of exhaust air from all parts of the interior and to facilitate washing and cleaning; and shall be so designed to confine residues within the spraying space. Aluminum shall not be used.

4.16.4 Spray booths.
Spray booths shall be designed, constructed and operated in accordance with the Ghana Fire Code.

4.16.5 Fire protection.
An automatic sprinkler system or fire-extinguishing system shall be provided in all spray rooms and spray booths, and shall be installed in accordance with Part 10.

4.17 DRYING ROOMS

4.17.1 General.
A drying room or dry kiln installed within a building shall be constructed entirely of approved noncombustible materials or assemblies of such materials regulated by the approved rules or as required in the general and specific clauses of this part for special occupancies and where applicable to the general requirements of this Code.

4.17.2 Piping clearance.
Overhead heating pipes shall have a clearance of not less than 51 mm (2 inches) from combustible contents in the dryer.

4.17.3 Insulation.
Where the operating temperature of the dryer is 79°C (175°F) or more, metal enclosures shall be insulated from adjacent combustible materials by not less than 305 mm (12 inches) of airspace, or the metal walls shall be lined with 6.4 mm ( \( \frac{3}{4} \) -inch) insulating mill board or other approved equivalent insulation.
4.17.4 Fire protection.

Drying rooms designed for high-hazard materials and processes, including special occupancies as provided for in Part 4, shall be protected by an approved automatic fire-extinguishing system complying with the provisions of Part 10.

4.18 ORGANIC COATINGS

4.18.1 Building features.

Manufacturing of organic coatings shall be done only in buildings that do not have pits or basements.

4.18.2 Location.

Organic coating manufacturing operations and operations incidental to or connected therewith shall not be located in buildings having other occupancies.

4.18.3 Process mills.

Mills operating with close clearances and that process flammable and heat-sensitive materials, such as nitrocellulose, shall be located in a detached building or noncombustible structure.

4.18.4 Tank storage.

Storage areas for flammable and combustible liquid tanks inside of structures shall be located at or above grade and shall be separated from the processing area by not less than 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

4.18.5 Nitrocellulose storage.

Nitrocellulose storage shall be located on a detached pad or in a separate structure or a room enclosed with not less than 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

4.18.6 Finished products.

Storage rooms for finished products that are flammable or combustible liquids shall be separated from the processing area by not less than 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

4.19 LIVE/WORK UNITS

4.19.1 General.

A live/work unit shall comply with Clauses 4.19.1 through 4.19.9.

Exception: Dwelling or sleeping units that include an office that is less than 10 percent of the area of the dwelling unit are permitted to be classified as dwelling units with accessory occupancies in accordance with Clause 6.11.2.

4.19.1.1 Limitations.

All of the following shall apply to live/work areas:

1. The live/work unit is permitted to be not greater than 279 m$^2$ (3,000 square feet) in area.

2. The nonresidential area is permitted to be not more than 50 percent of the area of each live/work unit.

3. The nonresidential area function shall be limited to the first or main floor only of the live/work unit.

4. Not more than five nonresidential workers or employees are allowed to occupy the nonresidential area at any one time.

4.19.2 Occupancies.

Live/work units shall be classified as a Group R-2 occupancy. Separation requirements found in Clauses 4.20 and Clause 6.11 shall not apply within the live/work unit where the live/work unit is in compliance with Clause 4.19. Nonresidential uses that would otherwise be classified as either a Group H or S occupancy shall not be permitted in a live/work unit.

Exception: Storage shall be permitted in the live/work unit provided that the aggregate area of storage in the nonresidential portion of the live/work unit shall be limited to 10 percent of the space dedicated to nonresidential activities.

4.19.3 Means of escape.

Except as modified by this clause, the means of escape components for a live/work unit shall be designed in accordance with Part 11 for the function served.
4.19.3.1 Escape capacity.
The escape capacity for each element of the live/work unit shall be based on the occupant load for the function served in accordance with Table 11.4.5.

4.19.3.2 Spiral stairways.
spiral stairways that conform to the requirements of Clause 11.11.10 shall be permitted.

4.19.4 Vertical openings.
Floor openings between floor levels of a live/work unit are permitted without enclosure.

4.19.5 Fire protection.
The live/work unit shall be provided with a monitored fire alarm system where required by Clause 10.7.2.9 and an automatic sprinkler system in accordance with Clause 10.3.2.8.

4.19.6 Structural.
Floors within a live/work unit shall be designed for the live loads in this code based on the function within the space.

4.19.7 Accessibility.
Accessibility shall be designed in accordance with Part 12 for the function served.

4.19.8 Ventilation.
The applicable ventilation requirements of this Code shall apply to each area within the live/work unit for the function within that space.

4.19.9 Plumbing facilities.
The nonresidential area of the live/work unit shall be provided with minimum plumbing facilities as specified by Part 30, based on the function of the nonresidential area. Where the nonresidential area of the live/work unit is required to be accessible by this Code the plumbing fixtures specified by Part 30 shall be accessible.

4.20 GROUPS I-1, R-1, R-2, R-3 AND R-4

4.20.1 General.
Occupancies in Groups I-1, R-1, R-2, R-3 and R-4 shall comply with the provisions of Clauses 4.20.1 through 4.20.10 and other applicable provisions of this Code.

4.20.2 Separation walls.
Walls separating dwelling units in the same building, walls separating sleeping units in the same building and walls separating dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as fire partitions in accordance with Clause 8.8.

Exceptions:
1. Where sleeping units include private bathrooms, walls between bedrooms and the associated private bathrooms are not required to be constructed as fire partitions.
2. Where sleeping units are constructed as suites, walls between bedrooms within the sleeping unit and the walls between the bedrooms and associated living spaces are not required to be constructed as fire partitions.
3. In Group R-3 and R-4 facilities, walls within the dwelling units or sleeping units are not required to be constructed as fire partitions.

4.20.3 Horizontal separation.
Floor assemblies separating dwelling units in the same buildings, floor assemblies separating sleeping units in the same building and floor assemblies separating dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as horizontal assemblies in accordance with Clause 8.11.

Exception: In Group R-3 and R-4 facilities, floor assemblies within the dwelling units or sleeping units are not required to be constructed as horizontal assemblies.

4.20.4 Automatic sprinkler system.
Group R occupancies shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.2.8. Group I-1 occupancies shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.2.6. Quick-response or residential automatic sprinklers shall be installed in accordance with Clause 10.3.3.2.

4.20.5 Fire alarm systems and smoke alarms.
Fire alarm systems and smoke alarms shall be provided in Group I-1, R-1 and R-2 occupancies in accordance with Clause
10.7.2.6, 10.7.2.8 and 10.7.2.9 respectively. Single- or multiple-station smoke alarms shall be provided in Groups I-1, R-2, R-3 and R-4 in accordance with Clause 10.7.2.10.

4.20.6 Smoke barriers in Group I-1, Condition 2.

Smoke barriers shall be provided in Group I-1, Condition 2 to subdivide every storey used by persons receiving care, treatment or sleeping and to provide other stories with an occupant load of 50 or more persons, into not fewer than two smoke compartments. Such stories shall be divided into smoke compartments with an area of not more than 2092 m$^2$ (22,500 square feet) and the distance of travel from any point in a smoke compartment to a smoke barrier door shall not exceed 60 960 mm (200 feet). The smoke barrier shall be in accordance with Clause 8.9.

4.20.6.1 Refuge area.

Refuge areas shall be provided within each smoke compartment. The size of the refuge area shall accommodate the occupants and care recipients from the adjoining smoke compartment. Where a smoke compartment is adjoined by two or more smoke compartments, the minimum area of the refuge area shall accommodate the largest occupant load of the adjoining compartments. The size of the refuge area shall provide the following:

1. Not less than 1.4 m$^2$ (15 net square feet) for each care recipient.
2. Not less than 0.56 m$^2$ (6 net square feet) for other occupants.

Areas or spaces permitted to be included in the calculation of the refuge area are corridors, lounge or dining areas and other low-hazard areas.

4.20.7 Group I-1 assisted living housing units.

In Group I-1 occupancies, where a fire-resistance corridor is provided in areas where assisted living residents are housed, shared living spaces, group meeting or multipurpose therapeutic spaces open to the corridor shall be in accordance with all of the following criteria:

1. The walls and ceilings of the space are constructed as required for corridors.
2. The spaces are not occupied as resident sleeping rooms, treatment rooms, incidental uses in accordance with Clause 6.12 or hazardous uses.
3. The open space is protected by an automatic fire detection system installed in accordance with Clause 10.7.
4. In Group I-1, Condition 1, the corridors onto which the spaces open are protected by an automatic fire detection system installed in accordance with Clause 10.7, or the spaces are equipped throughout with quick-response sprinklers in accordance with Clause 10.3.3.2.
5. In Group I-1, Condition 2, the corridors onto which the spaces open, in the same smoke compartment, are protected by an automatic fire detection system installed in accordance with Clause 10.7, or the smoke compartment in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with Clause 10.3.3.2.
6. The space is arranged so as not to obstruct access to the required exits.

4.20.8 Group I-1 cooking facilities.

In Group I-1 occupancies, rooms or spaces that contain cooking facilities with domestic cooking appliances shall be in accordance with all of the following criteria:

1. In Group I-1, Condition 1 occupancies, the number of care recipients served by one cooking facility shall not be greater than 30.
2. In Group I-1, Condition 2 occupancies, the number of care recipients served by one cooking facility and within the same smoke compartment shall not be greater than 30.
3. The types of domestic cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.
4. The space containing the domestic cooking facilities shall be arranged so as not to obstruct access to the required exit.

5. Domestic cooking hoods installed and constructed in accordance with Clause 505 of the International Mechanical Code shall be provided over cooktops or ranges.

6. Cooktops and ranges shall be protected in accordance with Clause 10.4.13.

7. A shutoff for the fuel and electrical supply to the cooking equipment shall be provided in a location that is accessible only to staff.

8. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.

9. A portable fire extinguisher shall be provided. Installation shall be in accordance with Clause 10.6 and the extinguisher shall be located within a 9144 mm (30-foot) distance of travel from each domestic cooking appliance.

4.20.8.1 Cooking facilities open to the corridor.
Cooking facilities located in a room or space open to a corridor, aisle or common space shall comply with Clause 4.20.8.

4.20.9 Group R cooking facilities.
In Group R occupancies, cooking appliances used for domestic cooking operations shall be in accordance with this Code.

4.20.10 Group R-2 dormitory cooking facilities.
Domestic cooking appliances for use by residents of Group R-2 college dormitories shall be in accordance with Clauses 4.20.10.1 and 4.20.10.2.

4.20.10.1 Cooking appliances.
Where located in Group R-2 college dormitories, domestic cooking appliances for use by residents shall be in compliance with all of the following:

1. The types of domestic cooking appliances shall be limited to ovens, cooktops, ranges, warmers, coffee makers and microwaves.

2. Domestic cooking appliances shall be limited to approved locations.

3. Cooktops and ranges shall be protected in accordance with Clause 10.4.13.

4. Cooktops and ranges shall be provided with a domestic cooking hood installed and constructed in accordance with this Code.

4.20.10.2 Cooking appliances in sleeping rooms.
Cooktops, ranges and ovens shall not be installed or used in sleeping rooms.

4.21 HYDROGEN FUEL GAS ROOMS

4.21.1 General.
Where required by the Ghana Fire Code, hydrogen fuel gas rooms shall be designed and constructed in accordance with Clauses 4.21.1 through 4.21.7.

4.21.2 Location.
Hydrogen fuel gas rooms shall not be located below grade.

4.21.3 Design and construction.
Hydrogen fuel gas rooms not classified as Group H shall be separated from other areas of the building in accordance with Clause 6.12.1.

4.21.3.1 Pressure control.
Hydrogen fuel gas rooms shall be provided with a ventilation system designed to maintain the room at a negative pressure in relation to surrounding rooms and spaces.

4.21.3.2 Windows.
Operable windows in interior walls shall not be permitted. Fixed windows shall be permitted where in accordance with Clause 8.16.

4.21.4 Exhaust ventilation.
Hydrogen fuel gas rooms shall be provided with mechanical exhaust ventilation in accordance with the applicable provisions of this Code.

4.21.5 Gas detection system.
Hydrogen fuel gas rooms shall be provided with a gas detection system that complies with Clauses 4.21.5.1, 4.21.5.2, and 10.16.

4.21.5.1 System activation.
Activation of a gas detection alarm shall result in both of the following:
1. Initiation of distinct audible and visible alarm signals both inside and outside of the hydrogen fuel gas room.

2. Automatic activation of the mechanical exhaust ventilation system.

4.21.5.2 Failure of the gas detection system. Failure of the gas detection system shall automatically activate the mechanical exhaust ventilation system, stop hydrogen generation, and cause a trouble signal to sound at an approved location.

4.21.6 Explosion control. Explosion control shall be provided where required by Clause 4.14.5.1.

4.21.7 Standby power. Mechanical ventilation and gas detection systems shall be provided with a standby power system in accordance with Clause 28.13.

4.22 AMBULATORY CARE FACILITIES

4.22.1 General. Occupancies classified as ambulatory care facilities shall comply with the provisions of Clauses 4.22.1 through 4.22.6 and other applicable provisions of this Code.

4.22.2 Separation. Ambulatory care facilities where the potential for four or more care recipients are to be incapable of self-preservation at any time shall be separated from adjacent spaces, corridors or tenants with a fire partition installed in accordance with Clause 8.8.

4.22.3 Smoke compartments. Where the aggregate area of one or more ambulatory care facilities is greater than 929 m² (10,000 square feet) on one storey, the storey shall be provided with a smoke barrier to subdivide the storey into not fewer than two smoke compartments. The area of any one such smoke compartment shall be not greater than 2092 m² (22,500 square feet). The distance of travel from any point in a smoke compartment to a smoke barrier door shall be not greater than 60 960 mm (200 feet). The smoke barrier shall be installed in accordance with Clause 8.9 with the exception that smoke barriers shall be continuous from outside wall to an outside wall, a floor to a floor, or from a smoke barrier to a smoke barrier or a combination thereof.

4.22.3.1 Means of escape. Where ambulatory care facilities require smoke compartmentation in accordance with Clause 4.22.3, the fire safety evacuation plans provided in accordance with Clause 11.2.2 shall identify the building components necessary to support a defend-in-place emergency response in accordance with the Ghana Fire Code.

4.22.3.2 Refuge area. Not less than 2.8 m² (30 net square feet) for each nonambulatory care recipient shall be provided within the aggregate area of corridors, care recipient rooms, treatment rooms, lounge or dining areas and other low-hazard areas within each smoke compartment. Each occupant of an ambulatory care facility shall be provided with access to a refuge area without passing through or utilizing adjacent tenant spaces.

4.22.3.3 Independent escape. A means of escape shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of escape originated.

4.22.4 Automatic sprinkler systems. Automatic sprinkler systems shall be provided for ambulatory care facilities in accordance with Clause 10.3.2.2.

4.22.5 Fire alarm systems. A fire alarm system shall be provided for ambulatory care facilities in accordance with 10.7.2.2.

4.22.6 Electrical systems. In ambulatory care facilities, the essential electrical system for electrical components, equipment and systems shall be designed and constructed in accordance with the provisions of Part 28.
4.23 STORM SHELTERS

4.23.1 General.
This clause applies to the construction of storm shelters constructed as separate detached buildings or constructed as rooms or spaces within buildings for the purpose of providing protection from storms that produce high winds, such as tornadoes and hurricanes during the storm. Such structures shall be designated to be hurricane shelters, tornado shelters, or combined hurricane and tornado shelters. Design of facilities for use as emergency shelters after the storm are outside the scope of ICC 500 and shall comply with this Code.

4.23.2 Construction.
In addition to other applicable requirements in this Code, storm shelters shall be constructed in accordance with ICC 500. Buildings or structures that are also designated as emergency shelters shall also comply with this Code.

4.23.3 Critical emergency operations.
In areas where the shelter design wind speed for tornadoes in accordance with Figure 304.2(1) of ICC 500 is 250 mph, 911 call stations, emergency operation centers and fire, rescue, ambulance and police stations shall comply with this Code and shall be provided with a storm shelter constructed in accordance with ICC 500.

4.23.4 Group E occupancies.
In areas where the shelter design wind speed for tornadoes is 250 mph in accordance with Figure 304.2(1) of ICC 500, all Group E occupancies with an occupant load of 50 or more shall have a storm shelter constructed in accordance with ICC 500.

Exceptions:
1. Group E day care facilities.
2. Group E occupancies accessory to places of religious worship.
3. Buildings meeting the requirements for shelter design in ICC 500.

4.23.4.1 Required occupant capacity.
The required occupant capacity of the storm shelter shall include all of the buildings on the site and shall be the greater of the following:

1. The total occupant load of the classrooms, vocational rooms and offices in the Group E occupancy.
2. The occupant load of any indoor assembly space that is associated with the Group E occupancy.

Exceptions:
1. Where a new building is being added on an existing Group E site, and where the new building is not of sufficient size to accommodate the required occupant capacity of the storm shelter for all of the buildings on the site, the storm shelter shall at a minimum accommodate the required occupant capacity for the new building.
2. Where approved by the Code official, the required occupant capacity of the shelter shall be permitted to be reduced by the occupant capacity of any existing storm shelters on the site.

4.23.4.2 Location.
Storm shelters shall be located within the buildings they serve or shall be located where the maximum distance of travel from not fewer than one exterior door of each building to a door of the shelter serving that building does not exceed 305 m (1,000 feet).

4.24 CHILDREN’S PLAY STRUCTURES

4.24.1 General.
Children’s play structures installed inside all occupancies covered by this Code that exceed 3048 mm (10 feet) in height or 14 m² (150 square feet) in area shall comply with Clauses 4.24.2 through 4.24.5.

4.24.2 Materials.
Children’s play structures shall be constructed of noncombustible materials or of combustible materials that comply with the following:

1. Fire-retardant-treated wood complying with Clause 24.3.2
2. Light-transmitting plastics complying with Clause 27.6.
3. Foam plastics (including the pipe foam used in soft-contained play equipment structures) having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance
with UL 1975 or when tested in accordance with NFPA 289, using the 20 kW ignition source.

4. Aluminum composite material (ACM) meeting the requirements of Class A interior finish in accordance with Part 9 when tested as an assembly in the maximum thickness intended for use.

5. Textiles and films complying with the fire propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of ASTM E84

6. Plastic materials used to construct rigid components of soft-contained play equipment structures (such as tubes, windows, panels, junction boxes, pipes, slides and decks) exhibiting a peak rate of heat release not exceeding 400 kW/m² when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation at a thickness of 6 mm.

7. Ball pool balls, used in soft-contained play equipment structures, having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance with UL 1975 or when tested in accordance with this code, using the 20 kW ignition source. The minimum specimen test size shall be 36 inches by 36 inches (914 mm by 914 mm) by an average of 21 inches (533 mm) deep, and the balls shall be held in a box constructed of galvanized steel poultry netting wire mesh.

8. Foam plastics shall be covered by a fabric, coating or film meeting the fire propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of this Code.

9. The floor covering placed under the children’s play structure shall exhibit a Class I interior floor finish classification, as described in Clause 9.4, when tested in accordance with ASTM E648

4.24.3 Fire protection.
Children’s play structures shall be provided with the same level of approved fire suppression and detection devices required for other structures in the same occupancy.

4.24.4 Separation.
Children’s play structures shall have a horizontal separation from building walls, partitions and from elements of the means of escape of not less than 1524 mm (5 feet). Children’s playground structures shall have a horizontal separation from other children’s play structures of not less than 6090 mm (20 feet).

4.24.5 Area limits.
Children’s play structures shall be not greater than 28 m² (300 square feet) in area, unless a special investigation, acceptable to the building official, has demonstrated adequate fire safety.

4.25 HYPERBARIC FACILITIES

4.25.1 Hyperbaric facilities.
Hyperbaric facilities shall meet the requirements contained in the Ghana Fire Code.

4.26 COMBUSTIBLE DUSTS, GRAIN PROCESSING AND STORAGE

The provisions of Clauses 4.26.1.1 through 4.26.1.7 shall apply to buildings in which materials that produce combustible dusts are stored or handled. Buildings that store or handle combustible dusts shall comply with the Ghana Fire Code.

4.26.1.1 Type of construction and height exceptions.
Buildings shall be constructed in compliance with the height, number of stories and area limitations specified in Clause 6.4 and 6.9; except that where erected of Type I or II construction, the heights and areas of grain elevators and similar structures shall be unlimited, and where of Type IV construction, the maximum building height shall be 19 812 mm (65 feet) and except further that, in isolated areas, the maximum building height of Type IV structures shall be increased to 25 908 mm (85 feet).

4.26.1.2 Grinding rooms.
Every room or space occupied for grinding or other operations that produce combustible dusts in such a manner that the room or space is classified as a Group H-2 occupancy shall be
enclosed with fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. The fire-resistance rating of the enclosure shall be not less than 2 hours
\[ \text{where the area is not more than } 279 \, \text{m}^2 (3,000 \, \text{square feet}), \text{and not less than } 4 \text{ hours where} \]
\[ \text{the area is greater than } 279 \, \text{m}^2 (3,000 \, \text{square feet}). \]

4.26.1.3 Conveyors.
Conveyors, chutes, piping and similar equipment passing through the enclosures of rooms or spaces shall be constructed dirt tight and vapour tight, and be of approved noncombustible materials complying with Part 31.

4.26.1.4 Explosion control.
Explosion control shall be provided as specified in the Ghana Fire Code, or spaces shall be equipped with the equivalent mechanical ventilation complying with this Code.

4.26.1.5 Grain elevators.
Grain elevators, malt houses and buildings for similar occupancies shall not be located within 9144 mm (30 feet) of interior plot lines or structures on the same plot, except where erected along a railroad right-of-way.

4.26.1.6 Coal pockets.
Coal pockets located less than 9144 mm (30 feet) from interior plot lines or from structures on the same plot shall be constructed of not less than Type IB construction. Where more than 9144 mm (30 feet) from interior plot lines, or where erected along a railroad right-of-way, the minimum type of construction of such structures not more than 19,812 mm (65 feet) in building height shall be Type III.

4.26.1.7 Tire rebuilding.
Buffing operations shall be located in a room separated from the remainder of the building housing the tire rebuilding or tire recapping operation by a 1-hour fire barrier.

**Exception:** Buffing operations are not required to be separated where all of the following conditions are met:

1. Buffing operations are equipped with an approved continuous automatic water-spray system directed at the point of cutting action.
2. Buffing machines are connected to particle-collecting systems providing a minimum air movement of 1,500 cubic feet per minute (cfm) (0.713 m³/s) in volume and 4,500 feet per minute (fpm) (23 m/s) in-line velocity.
3. The collecting system shall discharge the rubber particles to an approved outdoor noncombustible or fire-resistant container, which is emptied at frequent intervals to prevent overflow.

4.27 MEDICAL GAS SYSTEMS

4.27.1 General.
Medical gases at health care-related facilities intended for patient or veterinary care shall comply with Clauses 4.27.2 through 4.27.2.3 in addition to requirements of the Ghana Fire Code.

4.27.2 Interior supply location.
Medical gases shall be located in areas dedicated to the storage of such gases without other storage or uses. Where containers of medical gases in quantities greater than the permitted amount are located inside the buildings, they shall be located in a 1-hour exterior room, 1-hour interior room or a gas cabinet in accordance with Clause 4.27.2.1, 4.27.2.2 or 4.27.2.3, respectively. Rooms or areas where medical gases are stored or used in quantities exceeding the maximum allowable quantity per control area as set forth in Tables 307.1(1) and 307.1(2) shall be in accordance with Group H occupancies.

4.27.2.1 One-hour exterior room.
A 1-hour exterior room shall be a room or enclosure separated from the remainder of the building by fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both, with a fire-resistance rating of not less than 1 hour. Openings
between the room or enclosure and interior spaces shall be provided with self-closing smoke- and draft-control assemblies having a fire protection rating of not less than 1 hour. Rooms shall have not less than one exterior wall that is provided with not less than two vents. Each vent shall have a minimum free air opening of not less than 232 cm² (36 square inches) for each 28 m³ (1,000 cubic feet) at normal temperature and pressure (NTP) of gas stored in the room and shall be not less than 465 cm² (72 square inches) in aggregate free opening area. One vent shall be within 152 mm (6 inches) of the floor and one shall be within 152 mm (6 inches) of the ceiling. Rooms shall be provided with not less than one automatic fire sprinkler to provide container cooling in case of fire.

4.27.2.2 One-hour interior room.

Where an exterior wall cannot be provided for the room, a 1-hour interior room or enclosure shall be provided and separated from the remainder of the building by fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both, with a fire-resistance rating of not less than 1 hour. Openings between the room or enclosure and interior spaces shall be provided with self-closing smoke- and draft-control assemblies having a fire protection rating of not less than 1 hour. An automatic sprinkler system shall be installed within the room. The room shall be exhausted through a duct to the exterior. Supply and exhaust ducts shall be enclosed in a 1-hour rated shaft enclosure from the cabinet to the exterior. The average velocity of ventilation at the face of access ports or windows shall be not less than 1.02 m/s (200 feet per minute) with a minimum of 0.76 m/s (150 feet per minute) at any point of the access port or window.

3. Cabinets shall be provided with an automatic sprinkler system internal to the cabinet.

4.28 HIGHER EDUCATION LABORATORIES

4.28.1 Scope.

Higher education laboratories complying with the requirements of Clauses 4.28.1 through 4.28.4 shall be permitted to exceed the maximum allowable quantities of hazardous materials in control areas set forth in Tables 3.7.1(1) and 3.7.1(2) without requiring classification as a Group H occupancy. Except as specified in Clause 4.28, such laboratories shall comply with all applicable provisions of this Code and the Ghana Fire Code.

4.28.2 Application.

The provisions of Clause 4.28 shall be applied as exceptions or additions to applicable requirements of this Code. Unless specifically modified by Clause 4.28, the storage, use and handling of hazardous materials shall comply with all other provisions in the Ghana Fire Code and this Code for quantities not exceeding the maximum allowable quantity.

4.28.3 Laboratory suite construction.

Where laboratory suites are provided, they shall be constructed in accordance with this clause and the Ghana Fire Code. The number of laboratory suites and percentage of maximum allowable quantities of hazardous materials in laboratory suites shall be in accordance with Table 4.28.3.

a. Percentages shall be of the maximum allowable quantity per control area shown in Tables 3.7.1(1) and 3.7.1(2), with all increases allowed in the footnotes to those tables.
b. Fire barriers shall include walls, floors and ceilings necessary to provide separation from other portions of the building.
c. Vertical fire barriers separating laboratory suites from other spaces on the same floor shall be permitted to be 1-hour fire-resistance rated.

4.28.3.1 Separation from other nonlaboratory areas.
Laboratory suites shall be separated from other portions of the building in accordance with the most restrictive of the following:

1. Fire barriers and horizontal assemblies as required in Table 4.28.3. Fire barriers shall be constructed in accordance with Clause 8.7 and horizontal assemblies constructed in accordance with Clause 8.11.

Exception: Where an individual laboratory suite occupies more than one storey, the fire-resistance rating of intermediate floors contained within the laboratory suite shall comply with the requirements of this Code.

2. Separations as required by Clause 6.11.

4.28.3.2 Separation from other laboratory suites.
Laboratory suites shall be separated from other laboratory suites in accordance with Table 4.28.3.

4.28.3.3 Floor assembly fire resistance.
The floor assembly supporting laboratory suites and the construction supporting the floor of laboratory suites shall have a fire resistance rating of not less than 2 hours.

Exception: The floor assembly of the laboratory suites and the construction supporting the floor of the laboratory suites are allowed to be 1-hour fire-resistance rated in buildings of Types IIA, IIIA and VA construction, provided that the building is three or fewer stories.

4.28.3.4 Maximum number.
The maximum number of laboratory suites shall be in accordance with Table 4.28.3. Where a building contains both laboratory suites and control areas, the total number of laboratory suites and control areas within a building shall not exceed the maximum number of laboratory suites in accordance with Table 4.28.3.

4.28.3.5 Means of escape.
Means of escape shall be in accordance with Part 11.

4.28.3.6 Standby or emergency power.
Standby or emergency power shall be provided in accordance with Clause 4.14.5.2 where laboratory suites are located above the sixth storey above grade plane or located in a storey below grade plane.
4.28.7 Ventilation.
Ventilation shall be in accordance with this Code.

4.28.8 Liquid-tight floor.
Portions of laboratory suites where hazardous materials are present shall be provided with a liquid-tight floor.

4.28.9 Automatic fire-extinguishing systems.
Buildings containing laboratory suites shall be equipped throughout with an approved automatic sprinkler system in accordance with Clause 10.3.3.1.1.

4.28.4 Percentage of maximum allowable quantity in each laboratory suite.
The percentage of maximum allowable quantities of hazardous materials in each laboratory suite shall be in accordance with Table 4.28.3.
PART 5: SITE DEVELOPMENT AND LAND USE

5.1 GENERAL

5.1.1 Scope

This part provides requirements for land use, development and maintenance of building and building sites to minimize negative environmental impacts and to protect, restore and enhance the natural features and environmental quality of the site.

5.2 LAND USE CLASSIFICATION AND USES PERMITTED

5.2.1 Land Use Classification

The various land use classifications may be as indicated below:

a) Residential zone
   - Purely residential (R_1)
   - Residential with shop lines at ground floor (R_2)

b) Commercial zone
   - Local commercial area (C_1)
   - District commercial area (C_2)

c) Industrial zone
   - Service industries (I_1)
   - General industries (I_2)
   - Special industries (I_3)

d) Green zone

e) Special reservations

5.2.1.1 The various building uses and occupancies permitted on the various zones shall be as given in the Development Master Plan.

5.2.1.2 Uses to be in Conformity with the Zone

Where the use of buildings or premises is not specifically designated on the development plan, it shall be in conformity with the zone in which they fall.

5.2.1.3 Uses as Specifically Designated on Development Plan

Where the use of a site is specifically designated on the Development Plan, it shall be used only for the purpose so designated.

5.2.1.4 Non-conforming

Uses – No plot shall be put to any use, occupancy or premises other than the uses identified in Clause 5.2.1, except with the prior approval of the Authority.

5.3 MEANS OF ACCESS

5.3.1 Every building/plot shall abut on a public/private means of access like streets/roads duly formed.

5.3.2 Every person who erects a building shall not at any time erect or cause or permit to erect any building which in any way encroaches upon or diminishes the area set apart as means of access (including bicycle lanes) required in this Code. No building shall be erected so as to deprive any other building of the means of access.

5.3.3 Width of Means of Access

The residential plots shall abut on a public means of access like street/road. Plots which do not abut on a street/road shall abut/front on a means of access, the width and other requirements of which shall be as given in Table 5.1.

In no case, shall development on plots be permitted unless it is accessible by a public street of width not less than 6m.

Table 5.1 - Width and Length of Means of Access

<table>
<thead>
<tr>
<th>Row No.</th>
<th>Width of Means of Access m</th>
<th>Length of Means of Access m</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i)</td>
<td>6.0</td>
<td>75</td>
</tr>
</tbody>
</table>
5.3.3.1 Other Buildings

For all the industrial buildings, theatres, cinema houses, assembly halls, stadia, educational buildings, markets, other buildings which attract large crowd, the means of access shall not be less than the following:

<table>
<thead>
<tr>
<th>Width of Means of Access (m)</th>
<th>Length of Means of Access (m)</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0</td>
<td>200</td>
</tr>
<tr>
<td>15.0</td>
<td>400</td>
</tr>
<tr>
<td>18.0</td>
<td>600</td>
</tr>
<tr>
<td>24.0</td>
<td>Above 600</td>
</tr>
</tbody>
</table>

Further, in no case shall the means of access be lesser in width than the internal access ways in layouts and subdivisions.

5.3.3.2 - Pathways

The approach to the buildings from road/street/internal means of access shall be through paved pathway of width not less than 1.5m, provided its length is not more than 3.0m.

5.3.3.2.1 In the case of special housing schemes for low income group and economically weaker Clause of society developed up to two storeyed row/cluster housing scheme, the pedestrian pathway width shall be 3m subject to provisions of Clause 6.5.4.1(a). The pedestrian pathway shall not serve more than 8 plots on each side of the pathway; the length of the pathway shall be not more than 50m.

5.3.3.3 The length of the main means of access shall be determined by the distance from the farthest plot (building) to the public street. The length of the subsidiary access way shall be measured from the point of its origin to the next wider road on which it meets.

5.3.3.4 In the interest of general development of an area, the Authority may require the means of access to be of larger width than that required under Clause 5.3.3 and 5.3.3.1.

5.3.3.5 In existing built-up areas in the case of plots facing street/means of access less than 4.5m in width, the plot boundary shall be shifted to be away by 2.25m from the central line of the street/means of access way of 4.5m width.

5.3.4 The means of access shall be leveled, metalled, flagged, paved, sewered, drained, channeled, lighted, laid with water supply line and provided with trees for shade to the satisfaction of the Authority free of encroachment by any structure or fixtures so as not to reduce its width below the minimum required under Clause 5.3.3 and shall be maintained in a condition to the satisfaction of the Authority.

5.3.4.1 If any private street or any other means of access to a building is not leveled, metalled, flagged or paved, sewered, drained, channeled, lighted or laid with water supply line or provided with trees for shade to the satisfaction of the Authority, who may, with the sanction of the Authority, by written notice require the owner or owners of the several premises fronting or adjoining the said street or other means of access or abutting thereon or to which access is obtained through such street or other means of access or which shall benefit by works executed, to carry out any or more of the aforesaid requirements in such manner as he shall direct.

5.3.4.2 If any structure or fixture is set upon a means of access so as to reduce its width below the minimum required, the Authority may remove the same further and recover the expenses so incurred from the owner.
5.3.5 Access from Highways/Important Roads

No premises other than highway amenities like petrol pumps, motels, etc. shall have an access direct from highways and such other roads not less than 52m in width, which the Authority with the approval of the Highway Authority shall specify from time to time. The Authority shall maintain a register of such roads which shall be open to public inspection at all times during office hours. The portion of such roads on which direct access may be permitted shall be as identified in the Development Plan. However, in the case of existing development on highways/other roads referred to above, the operation of this clause shall be exempted. These provisions shall, however, be subject to the provisions of the relevant National Highway Act.

5.3.6 For high rise buildings and buildings other than residential, the following additional provisions of means of access shall be ensured:

a) The width of the main street on which the building abuts shall not be less than 12m and one end of this street shall join another street not less than 12m in width.

b) The approach to the building and open spaces on all its sides up to 6m width and the layout for the same shall be done in consultation with the Chief Fire Officer of the city and the same shall be hard surface capable of taking the weight of fire engine, weighing up to 18 tonnes. The said open space shall be kept free of obstructions and shall be motorable.

c) The main entrance to the plot shall be of adequate width to allow easy access to the fire engine and in no case shall it measure less than 4.5m. The entrance gate shall fold back against the compound wall of the premises, thus leaving exterior accessway within the plot free for movement of fire service vehicle. If the main entrance at the boundary wall is built over, the minimum clearance shall be 4.5m.

5.3.7 Cul-de-sacs giving access to plots and extending from 150 to 275m in length with an additional turning space at 150m will be allowed only in residential areas, provided cul-de-sacs would be permissible only on straight roads and further provided the end of cul-de-sacs shall be higher in level than the level of the starting point of such dead end road. The turning space in this case shall be not less than 81 m in area, with no dimension less than 9m.

5.3.8 InterClause of Roads

For interClause junctions of roads meeting at right angles as well as other roads meeting at right angles as well as other than rights angles, the rounding off or cut off or splay or similar treatment shall be done, to the approval of the Authority, depending upon the width of roads, the traffic generated, the sighting angle, etc. to provide clear sight distance.

5.3.9 The building line shall be set back at least 3m from internal means of access in a layout of buildings in a plot subject to provisions of Clause 5.6.2.1.

5.4 COMMUNITY OPEN/SOCIAL SPACES AND AMENITIES

5.4.1 Residential and Commercial Zones

In any layout or sub-division of land measuring 0.3 hectare of more in residential and commercial zones, the community open spaces shall be reserved for recreational purposes which shall as far as possible be provided in one place or planned out for the use of the community in clusters or pockets.

5.4.1.1 The community open spaces shall be provided catering to the needs of area of layout, population for which the layout is planned and the category of dwelling units. The following minimum provision shall be made:

a) 15 percent of the area of the layout, or

b) 0.3 to 0.4 ha/1000 persons; for low income housing the open spaces
shall be 0.3 ha/1000 persons.

5.4.2 No recreational space shall generally be less than 450 m².

5.4.2.1 The minimum average dimension of such recreational space shall be not less than 7.5m; if the average width of such recreational space is less than 24m, the length thereof shall not exceed 2.5 times the average width. However, depending on the configuration of the site, commonly open spaces of different shapes may be permitted by the Authority, as long as the open spaces provided serve the needs of the immediate community contiguous to the open spaces.

5.4.2.2 In such recreational spaces, a single storeyed structure as pavilion or gymnasium up to 25m² in area may be permitted; such area may be excluded from FAR calculations; no toilet block shall be permitted.

5.4.3 Each recreational area and the structure on it shall have an independent means of access. Independent means of access may not be insisted upon if recreational space is approachable directly from every building in the layout. Further, the building line shall be at least 3m away from the boundary of recreational open space.

5.4.4 Industrial Zones

In the case of sub-division of land in industrial zones of area 0.8 hectare or more, 5 percent of the total area shall be reserved as amenity open space which shall also serve as a general parking space; when such amenity open space exceeds 1500 m², the excess area could be utilized for the construction of buildings for banks, canteens, welfare centres and such other common purposes considered necessary for the industrial user, as approved by the Authority.

5.4.4.1 In all industrial plots measuring 100 m² or more in area, 10 percent of the total area shall be provided as an amenity open space to a maximum of 2500 m². Such an amenity open space shall have a means of access and shall be so located that it could be conveniently utilized as such by the persons working in the industry.

5.4.5 Other Amenities

In addition to community open/social spaces, the layouts shall provide for the following, depending on the magnitude of the settlement and as decided by the Authority.

a) Educational Facilities - Nursery school, primary school, middle school, high school or college as applicable.

b) Health facility - Clinic, health centre, dispensary or hospital, as applicable.

c) Commercial facility (including shopping facility) – Booth(kiosk/container), shops, convenience shopping centre, local shopping centre, or zonal shopping centre, as applicable.

d) Communication facilities and essential services – Post office, post and telegraph, police post, police station, fire station.

e) Social, community and cultural facilities - Religious building, community hall, welfare centre, cinema.

Note: The requirements of essential amenities for low income housing shall be given in Appendix D.

5.4.6 Every layout or subdivision shall take into account the provisions of development plan and if the land is affected by any reservation for public purposes, the Authority may agree to adjust the location of such reservations to suit the development.

5.5 REQUIREMENTS OF PLOTS

5.5.1 No building shall be constructed on any site, on any part of which there is deposited
refuse, excreta or other offensive matter objectionable to the Authority, until such refuse has been removed there from and the site has been prepared or left in a manner suitable for building purposes to the satisfaction of the Authority.

5.5.2 Damp Sites
Wherever the dampness of a site or the nature of the soil renders such precautions necessary, the ground surface of the site between the walls of any building erected thereon shall be rendered damp-proof to the satisfaction of the Authority.

5.5.3 Surface Water Drains
Any land passage or other area within the curtilage of a building shall, if the Authority so requires, be effectively drained by surface water drains or other means.

5.5.3.1 The written approval of the Authority shall be obtained for connecting any subsoil or surface water drain to a sewer.

5.5.4 Underground cisterns for water storage
The provision of underground cisterns for water storage in public and private buildings shall be encouraged.

5.5.5 Distance from Electric Lines
No verandah, balcony, or the like shall be allowed to be erected or re-erected or any additions or alterations made to a building within the distances quoted below in accordance with the current Ghana Electricity Rules and its amendments from time to time between the building and any overhead electric supply line.

(Plus 0.3m for every part thereof)
(plus 0.3m for every part thereof)

5.5.6 Distance of site from the normal edge of water course/area may be specified by the Authority, keeping in view the normal maximum flood/tide level.

5.5.7 Size of Plots
5.5.7.1 Residential
Each plot shall have a minimum size/frontage corresponding to the type of development as given below:

<table>
<thead>
<tr>
<th>Type of Development</th>
<th>Plot Size m²</th>
<th>Frontage M</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detached building</td>
<td>Above 250</td>
<td>Not Below 6</td>

<tr>
<td>Semi-detached building</td>
<td>125 – 250</td>
<td>Not Below 4.5</td>
</tr>
<tr>
<td>Row type building</td>
<td>50 – 125</td>
<td>Not Below 4.5</td>
</tr>
</tbody>
</table>

Note – For low income housing see Appendix D.
5.5.7.1.1 The minimum size of the site for group housing development shall be as given in the Master Plan and local development control rules.

5.5.7.2 Industrial
The size of the plot shall not be less than 300 m² and its width shall not be less than 15 m.

5.5.7.3 Other Land uses
The minimum size of plots for buildings for other uses like business, educational, mercantile, assembly (cinema theatre), petrol filling station, etc. shall be as decided by the Authority subject to 5.5.7.3.1.

5.5.7.3.1 Assembly Halls/Cinema Theatres
The minimum size of plot for assembly buildings/cinema theatres used for public entertainment and religious/social centres, with fixed seats shall be on the basis of seating capacity of the building at the rate of 1 m² per seat.

5.5.7.3.2 Fuel/Gas filling Station
The size of the plot shall not be less than:

- a) 31 x 17m in the case of petrol filling station with kiosk without service bay, and 37 x 31 m in the case of petrol filling station with service bay.

5.6 OPEN SPACES (WITHIN A PLOT)

5.6.1 General
Every room intended for human habitation shall abut on an interior or exterior open space or an open verandah, open to such interior or exterior open space.

5.6.1.1 The open spaces inside and around a building have essentially to cater for the lighting and ventilation requirements of the rooms abutting such open spaces, and in the case of buildings abutting on streets in the front, rear or sides, the open spaces provided shall be sufficient for the future widening of such streets.

5.6.1.2 Open spaces separate for each building of wing –
The open spaces shall be separate or distinct for each building and where a building has two or more wings, each wing shall have separate or distinct open spaces for the purposes of lighting and ventilation of the wings. However, separation between accessory and main buildings more than 7m in height shall not be less than 1.5m; for buildings up to 7m in height, no such separation shall be required.

5.6.2 Residential Buildings

5.6.2.1 Exterior open Spaces

5.6.2.1.1 Front Open Space
a) Every building fronting a street shall have a front space, forming an integral part of the site as below:

| Front open space, Minimum Width of street Fronting the plot (M) (m) |
|-------------------------|-----------------|
| 1.5*                   | Up to 7.5*      |
| 3.0                    | 7.5 to 18       |
| 4.5                    | 18 to 30        |
| 6.0                    | Above 30        |

* For buildings up to a maximum height 7m.

Note – In case a building abuts two or more streets, the value of open spaces is to be based on the average width of streets,
subject to a minimum of 1.8m for cases (ii), (iii) and (iv) of Table 4.1, above.

b) For streets less than 7.5m in width, the distance of the building (building line) shall be at least 5m from the centre line of the street See 5.3.3.5.

Note – This limiting distance has to be determined by the Authority for individual road/street widths taking into account the traffic flow.

5.6.2.1.2 Rear Open Space

a) Every residential building shall have a rear open space, forming an integral part of the site, of an average width of 3m and at no place measuring less than 1.8m, except that in the case of a back-to-back-site, the width of the rear open space shall be 3m throughout. Subject to the condition of free ventilation, the open space left up to half the width of the plot shall also be taken into account for calculating the average width of the rear open space. For plots of depth less than 9m, for buildings up to 7m in height, the rear open space may be reduced to 1.5m.

b) Rear Open Space to Extend Throughout the Rear Wall – The rear open space shall be co-extensive with the entire face of the rear wall. If a building abuts on two or more streets, such rear open space shall be provided throughout the face of the rear wall. Such rear wall shall be the wall on the opposite side of the face of the building abutting on the wider street unless the Authority directs otherwise.

5.6.2.1.3 Side Open Space

a) Every semi-detached and detached building shall have a permanently open air space, forming an integral part of the site as below:

(i) For detached buildings there shall be a minimum side open space of 3m on both the sides.

NOTE: For detached residential buildings up to 7m in height on plots with a frontage less than 12m, one of the side open spaces may be reduced to 1.5m.

(iii) For row-type buildings, no side open is required.

(b) In the case of semi-detached buildings, the open spaces provided on one side shall be as in Clause 5.6.2.1.3 and all habitable rooms shall abut either on this side open space or front and rear open spaces or an interior open space Clause 5.6.2.5.

5.6.2.2 The provisions of Clause 5.6.2.1.2 and 5.6.2.1.3 are not applicable to parking lock-up garages up to 3m in height located at a distance of 7.5m from any street line or front boundary of the plot.

5.6.2.3 The open spaces mentioned in Clause 5.6.2.1.1 to 5.6.2.1.3 shall be for residential buildings up to a height of 10m.

5.6.2.3.1 For buildings of height above 10m, the open spaces (side and rear) shall be as given in Table 5.2. The front open spaces for increasing heights of buildings shall be governed by 6.5.4.1(a).

TABLE 5.2 - Side and Rear Open Spaces for different Heights of Buildings

<td>40</td>
<td>12</td>
<td></td>
</tr>
</tbody>
</table>
Note 1 – For buildings above 24m in height, there shall be a minimum front open space of 6m.

Note 2 – Where rooms do not derive light and ventilation from the exterior open space, the width of such exterior open space as given in Col. 3 may be reduced by 1m subject to a minimum of 3m and a maximum of 8m. No further projections shall be permitted.

Note 3 – If the length or depth of the building exceeds 40m, add to Col. 3 ten percent of length or depth of building minus 4.0m.

5.6.2.3.2 For tower-like structures, as an alternative to 5.6.2.3., open spaces shall be as below:

a) up to a height of 24m, with one set-back, the open spaces at the ground level, shall be not less than 6m;

b) for heights between 24m and 37.5m with one set-back, the open spaces at the ground level, shall be not less than 9m;

c) for heights above 37.5m with two set-backs, the open spaces at the ground level, shall be not less than 12m; and

d) the deficiency in the open spaces shall be made good to satisfy 5.6.2.3.1. through the set-backs at the upper levels; these set-backs shall not be accessible from individual rooms/flats at these levels.

5.6.2.4 The front open space would govern the height of the building (see 6.5.4).

5.6.2.5 Interior Open Spaces

a) Inner Courtyard – In case the whole of one side of every room excepting bath, WC and store room is not abutting on either the front, rear or side(s) open spaces, it shall abut on an inner courtyard, whose minimum width shall be 3m.

Further, the inner courtyard shall have an area, throughout its height, of not less than the square of one-fifth the height of the highest wall abutting the courtyard. Provided that when any room (excluding staircase bay, bathroom and water-closet) is dependent for its light and ventilation on an inner courtyard, the dimension shall be such as is required for each wing of the building.

Where only water closet and bath room are abutting on the interior courtyard, the size of the interior courtyard shall be in line with the provision for ventilation shaft as given in Clause 5.6.2.5(b))

b) Ventilation Shaft – For ventilating the spaces for water closets and bath rooms, if not opening on to front, side, rear and interior open spaces, these shall open on to the ventilation shaft, the size of which shall not be less than the values given below:

<table>
<thead>
<tr>
<th>Height of Buildings m</th>
<th>Size of Ventilation Shaft m²</th>
<th>Minimum Size of Shaft m</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 10</td>
<td>1.2</td>
<td>0.9</td>
</tr>
<tr>
<td>12</td>
<td>2.8</td>
<td>1.2</td>
</tr>
<tr>
<td>18</td>
<td>4.0</td>
<td>1.5</td>
</tr>
<tr>
<td>24</td>
<td>5.4</td>
<td>1.8</td>
</tr>
<tr>
<td>30</td>
<td>8.0</td>
<td>2.4</td>
</tr>
<tr>
<td>Above 30</td>
<td>9.0</td>
<td>3.0</td>
</tr>
</tbody>
</table>

Note 1 – For buildings of height above 30m, a mechanical ventilation system shall be installed besides the provision of minimum ventilation shaft.

Note 2 – For fully air-conditioned residential buildings for lodging purposes, the ventilation shaft need not be insisted upon, provided the air-conditioning system works in an uninterrupted manner, also, provided there is an alternative source of power supply.

c) Outer Courtyard – The minimum width of the outer courtyard (as distinguished from its depth) shall be not less than 2.4m. If the width of the outer courtyard is less than 2.4m, it shall be treated as a notch and the provisions of outer courtyard shall not apply. However, it the depth of the outer courtyard is more than the width, the provisions of 5.6.1.2 shall apply for the open spaces to be left between the wings.
5.6.2.6 Joint Open Air Space –

Every such interior or exterior open air space, unless the latter is a street, shall be maintained for the benefit of such building exclusively and shall be entirely within the owner’s own premises.

5.6.2.6.1 If such interior or exterior open air space is intended to be used for the benefit of more than one building belonging to the same owner, the width of such open air space shall be the one specified for the tallest building as specified in 5.6.2.3 abutting on such open air space.

5.6.2.6.2 If such interior or exterior open air space is jointly owned by more than one person, its width shall also be as specified in Clause 5.6.2, provided every such person agrees in writing to allow his portion of such joint open air space to be used for the benefit of every building abutting on such joint open air space and provided he sends such written consent to the Authority for record. Such common open air space shall thenceforth be treated as a permanently open air space required for the purposes of the Code. No boundary wall between such joint open air space shall be erected or raised to a height of more than 2.0m.

5.6.3 Other Occupancies

5.6.3.1 Open spaces for other occupancies shall be as below:

a) **Educational Buildings** – Except for nursery schools, the open spaces around the building shall be not less than 6m;

b) **Institutional Buildings** – The open spaces around the building shall be not less than 6m; and

c) **Assembly Buildings** – The open space at front shall be not less than 12m and the other open spaces around the building shall be not less than 6m.

Note – However, if assembly buildings are permitted in purely residential zones, the open spaces around the building shall be not less than 12m.

d) **Business, Mercantile and Storage Buildings** – The open spaces around the building shall be not less than 4.5m. Where these occur in a purely residential zone or in a residential with shops line zone, the open spaces may be relaxed.

e) **Industrial Buildings** – The open spaces around the building shall be not less than 4.5m for heights up to 16m, with an increase of the open spaces of 0.25m for every increase of 1m or fraction thereof in height above 16m.

Note – Special rules for narrow industrial plots in the city, namely plots less than 15m in width, in the city, namely plots less than 15m in width, and with appropriate setbacks from certain streets and highways, shall be applicable.

f) **Hazardous Occupancies** – The open spaces around the building shall be as specified for industrial buildings (see 5.6.2.1(e)).

5.6.4 Exemption to Open Spaces

5.6.4.1 Projections into Open Spaces –

Every open space provided either interior or exterior shall be kept free from any erection thereon and shall be open to the sky, except as below:

a) cornice, roof or weather shade not more than 0.75m wide;

b) sunshades over windows/ventilators or other openings not more than 0.75m wide;

c) canopy at first floor level, but not to be used as a sit out with clearance of 1.5m between the plot boundary and the canopy;

d) projected balcony at higher floors of width not more than 0.9m; and

e) projecting rooms/balconies (see (d) at alternate floors such that rooms of the lower two floors get light and air and the projection being not more than the height of the storey immediately below.
However, these projections into open spaces shall not reduce the minimum required open spaces.

5.6.4.1 Accessory Building

The following accessory buildings may be permitted in the open spaces:

a) In an existing building, sanitary block of 2.4m in height subject to a maximum of 4m² in the rear open space at a distance of 1.5m from the rear boundary may be permitted, where facilities are not adequate.

b) Parking lock up garages not exceeding 2.4m in height shall be permitted in the side or rear open spaces at a distance of 7.5m form any road line or the front boundary of the plot; and

c) Suction tank and pump room each up to 2.5m² in area.

5.6.4.2 Projection into Street

5.6.4.2.1 In existing built-up or congested areas, no projection of any sort whatsoever, except sunshades (see 5.6.4.2.3) extending more than 230mm below a height of 4.3m, shall project over the road or over any drain or over any portion outside the boundaries of the site, provided the projection arising out of the vertical part of the rain-water spouts projecting at the road level or the water pipe may be permitted in accordance with the drainage plan.

5.6.4.2.2 Porticos in Existing Developed Area

Porticos in bazaar/shopping areas of existing developed areas may be permitted to project on road land subject to the following limitations:

a) porticos may be allowed on such roads leaving a minimum clear space of 18m between kerbs;

b) the porticos shall not be less than 3m wide;

c) nothing shall be allowed to be constructed on the portico which shall be constructed on the portico which shall be used as an open terrace;

d) nothing shall be allowed to project beyond the line of arcades; and

e) the space under the portico shall be paved and channeled according to the directions of the Authority.

5.6.4.2.3 Sunshades Over Windows and Ventilators –

Projections of sunshades over windows or ventilators in existing built-up or congested areas when permitted by the Authority shall fulfill the following conditions.

a) no sunshade shall be permitted over the road or over any drain or over any portion outside the boundaries of the site below a height of 2.8m from the road level;

b) sunshades provided above a height of 2.8m from the ground level shall be permitted to project up to a maximum width of 600mm, if the road over which they project exceeds 9m in width; and

c) no sunshade shall be permitted on roads less than 9m in width or on roads having no footpaths.

5.6.5 Limitations to Open Spaces

5.6.5.1 Safeguard Against Reduction of Open Space

No construction work on a building shall be allowed if such work operates to reduce an open air space of any other adjoining building, belonging to the same owner to an extent less than what is prescribed at the time of the proposed work or to reduce further such open space if it is already less than that prescribed.

5.6.5.2 Additions or Extensions to a Building

Additions or extensions to a building shall be allowed, provided the open spaces for the
additions/extensions satisfy 5.6.2 after such additions/extensions are made.

5.7 OFF-STREET PARKING SPACES

5.7.1 The off-street parking (on-site parking) spaces in a plot to be provided shall be in accordance with Appendix B. The spaces given in Appendix B shall be considered by the Authority in conjunction with the Development Rules, in force, if any.

5.8 GREENBELTS AND LANDSCAPING

5.8.1 General

Greenbelts and landscaping including plantation of shrubs and trees help to certain extent in enhancing the environmental quality.

5.8.1.1 Planting of trees in streets and in open spaces should be done carefully to take advantage of both shades and sunshine without handicapping the flow of natural winds. Their advantage for abating glare and for providing cool and/or warm pockets in developed areas should also be taken.

5.8.1.2 Where relief from noise is to be provided by means of greenbelts, these may be of considerable width and be landscaped. The extent of relief that may be derived from the above may be estimated only after considering other environmental factors. Strong leafy trees may be planted to act as noise baffles. Shrubs or creepers may also be planted for additional protection between tree trunks; artificial mounds and banks should be formed wherever practicable.

5.8.2.1 Suitable provisions may be made for greeneries including plantation of shrubs and trees as a part of environmental protection in general. This aspect shall be taken care of from the initial stage of town and country planning, zoning and planning of development of particular area and group housing. Finally, this aspect shall also be taken into account in planning individual building of different occupancies. A guide for the quantum of plantation of shrubs, trees and other greenery in different occupancies and community spaces is given in Appendix C.

5.8.2.2 The types of plants, the distance between tree/plants from the building and the distance between plants shall be carefully worked out keeping in view of the structural safety and aesthetic requirements of buildings.

5.8.3 Trees shall be numbered area-wise, plot-wise and road-wise by the concerned authority and they shall be checked periodically.

5.8.4 Cutting and pruning of trees in public as well as private areas shall be suitably regulated. Trees shall be cut only after obtaining the permission of the Authority designated for this purpose.

APPENDIX B

OFF-STREET PARKING SPACES

B-1 The spaces to be left out for off-street parking as given in B-2 shall be in addition to the open spaces left out for lighting and ventilation purposes as given in Clause 4.14. However, one row of car parking may be provided in the front open space of 12m without reducing the clear vehicular access way to less than 6m.

B-1.1 Further 50 percent of the open spaces required around buildings under 4.8 may be allowed to be utilized for parking or loading or unloading spaces, provided that a minimum distance of 3.6 m around the building shall be kept free from any parking, loading or unloading spaces.

B-2 Each off-street parking space provided for motor vehicles (cars) shall not be less than 13.75 m² in area, and for scooters and cycles the parking spaces provided shall not be less than 1.25m² and 1.00 m² respectively.

B-3 For buildings of different occupancies, off-street parking space for vehicles shall be provided as stipulated below:
a) **Motor Vehicles** – Space shall be provided as specified in Table 4.8 for parking motor vehicles (cars)

b) **Other Types of Vehicles** – For non-residential buildings, in addition to the parking areas provided in (a) above, 25 to 50 percent additional parking space shall be provided for parking other types of vehicles and the additional spaces required for other vehicles shall be as decided by the Authority, keeping in view the nature of traffic generated in the city.

**B-4** Off-street parking space shall be provided with adequate vehicular access to a street; and the area of drives, aisles and such other provisions required for adequate manoeuvering of vehicle shall be exclusive of the parking space stipulated in these rules.

**B-5** If the total parking space required by these rules is provided by a group of property owners for their mutual benefits, such use of this space may be construed as meeting the off-street parking requirements under these rules, subject to the Approval of the Authority.

**B-6** In addition to the parking spaces provided, for buildings of mercantile (commercial), industrial and storage type at the rate of one such space of 3.5 x 7.5m, for loading and unloading activities, for each 1000m² of floor area or fraction thereof, shall be provided.

**B-7** Parking spaces shall be paved and clearly marked for different types of vehicles.

**B-8** In the case of parking spaces provided in basements, at least two ramps of adequate width and slope shall be provided, located preferably at opposite ends.

APPENDIX C
GUIDE FOR PLANTATION OF SHRUBS, TREES AND GREENERY

C-1 The norms for plantation of shrubs, trees and other greeneries for residential, educational, institutional and industrial occupancies shall be as follows:

<table>
<thead>
<tr>
<th>Occupancy</th>
<th>Plot Size ( \text{mm}^2 )</th>
<th>Greenery to be Planted, Minimum</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Residential</td>
<td>For smaller plots (smaller than 200 ( \text{m}^2 )), EWS housing, slum areas and the like</td>
<td>For every 50 families create one small community space of about 100 ( \text{m}^2 ) where clumps of trees may be planted so as to provide shade and improve the quality of environment</td>
</tr>
<tr>
<td></td>
<td>200 and above</td>
<td>i) 10 percent of open space to be left unpaved for greenery with at least two small/medium trees up to plot area of 500 ( \text{m}^2 ) ii) An additional one tree for every 100 ( \text{m}^2 ) area of plot or part thereof above 500 ( \text{m}^2 ).</td>
</tr>
</tbody>
</table>
### C-2
For other occupancies namely assembly, business, mercantile, the quantum of greenery shall be planned taking the development as a whole. However, a minimum of 50 trees shall be provided per hectare; 25 percent of the permissible open space to be covered by greenery such as shrubs, grass, and suitably landscaped.

### C-3 COMMUNITY SPACES

#### C-3.1 Community Open Spaces – The open spaces to be left in the total development of the area are covered in 5.4. These open spaces should be suitably landscaped. A minimum of 125 trees per hectare shall be provided.

#### C-3.2 Roads in a Development Plan –
Trees shall be provided on either side of the road or on both sides depending upon the width of the roads, the location of building along the road side and other considerations. However, minimum one tree for every 10m shall be provided.

### APPENDIX D

#### D-1 GENERAL

**D-1.1** These requirements cover the planning and general building requirements of low income housing developed as clusters (Table 4.9). The requirements regarding layout planning of low income housing clusters are applicable to public agencies (government bodies). The requirements on design and construction of buildings for low income housing in approved layouts are applicable to public agencies/government bodies or private builders.

**D-1.2** In these planning standards, the general plan requirement for community open spaces estimated at 0.3 ha for thousand persons is provided; road areas are worked out between 10 and 20 percent of the site area; one nursery school of 0.1 ha is provided for a population of 1500 and shopping centres at 4 shops per thousand populations are also covered. It would, therefore, be seen that even for apparently high densities, the basic

<table>
<thead>
<tr>
<th>Occupancy</th>
<th>Minimum Land Area</th>

<th>Open Space Coverage</th>
</tr>
</thead>
<tbody>
<tr>
<td>b) Educational and Institutional</td>
<td>300 – 1000</td>
<td>i) 125 trees per hectare</td>
<td>ii) 50 percent of the permissible open space for greenery</td>
</tr>
<tr>
<td>c) Industrial</td>
<td>Above 1000</td>
<td>i) 150 trees per hectare</td>
<td>ii) 40 percent of the permissible open space to be covered by greenery</td>
</tr>
</tbody>
</table>

Note – Landscape proposal shall be got approved from the Local Authority along with the building plan for group housing schemes.

Note 1 – For industrial plots, it is advisable to have peripheral plantation to minimize pollution especially air and noise pollution.

Note 2 – Large polluting industry should be separated from the neighbouring residential area by a thick green belt which should occupy an area of about 15 percent of the industrial area.

Note 3 – Landscape proposal shall be got approved from the local Authority along with the building plan.
requirements and community facilities are also taken care of.

D-1.3 It is emphasized that this type of development should apply to clusters of 400 dwelling units, so distributed in the development under consideration as to maintain the overall densities of the master plan for the area (see Note 1 of Table 5.9).

Table 5.9 - Maximum Densities for Low Income Housing

<table>
<thead>
<tr>
<th>Col.</th>
<th>Density in Dwelling Units/Ha for No. of Storeys</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Plinth area of unit of 20 m² 30 m²</td>
</tr>
<tr>
<td>No.</td>
<td></td>
</tr>
<tr>
<td>i)</td>
<td>130 85</td>
</tr>
<tr>
<td>ii)</td>
<td>250 170</td>
</tr>
<tr>
<td>iii)</td>
<td>300 225</td>
</tr>
<tr>
<td>iv)</td>
<td>350 260</td>
</tr>
<tr>
<td>v)</td>
<td>400 300</td>
</tr>
</tbody>
</table>

Note 1 – These densities are applicable to a cluster of dwelling up to 400, with a family of 5 members.

Note 2 – Vertical incremental housing shall be permitted in single ownership plot.

Note 3 – These densities include provision for open spaces, convenience-shopping, nursery, and all internal roads and pathways, but do not include peripheral road around the cluster.

Note 4 – The minimum density shall be 75 percent of the above.

D-2 PLANNING

D-2.1 Type of Development – The type of development for low income housing shall be plotted development as row housing/flatted development as row housing/block development as group housing.

D-2.2 Density – The maximum density, in dwelling units/hectare, shall be as given in Table 4.9.

D-2.3 Size of Plot/Plinth Area – The minimum plot size shall be as follows, with coverage not exceeding 75 percent.

<table>
<thead>
<tr>
<th>Minimum plot size</th>
<th>Type of Development</th>
</tr>
</thead>
<tbody>
<tr>
<td>30 m²</td>
<td>Incremental housing with one room, cooking space and combined bath and WC on ground floor and future extension of one room and a bath on the first floor/ground floor</td>
</tr>
<tr>
<td>40 m²</td>
<td>Two roomed house on each floor for group housing/individual ownership house</td>
</tr>
</tbody>
</table>

Note 1 – The minimum size of plots takes into account the need of incremental housing. In the case of cities (other than metropolitan cities) with population less than 0.5 million, the size of the plots may be increased by 33 1/3 percent

Note 2 – In exceptional cases in metropolitan cities with population more than 1 million, the size of plots may be brought down to 25m² in the cases of low income house colonies located in congested areas or in areas as decided by the Authority.

D-2.3.1 Minimum Frontage –

The minimum frontage of the plot shall be 3.6m in width.

Note - The minimum frontage of 3.6m is desirable. For an economical layout, group housing appears to be a good solution. But if plotted development is to be adopted and if there are occasions when sufficient frontage is not available, the same may be reduced to 3m.

D-2.4 Height of Building –

The height of building shall not exceed 15m.

Note - For buildings up to the height of 15m, there is no need to provide lifts.
D-5 Other Requirements (to be edited)

D-5.1 One water tap per dwelling unit may be provided, where adequate drinking water supply is available. If supply is inadequate, public hydrants shall be provided. In the absence of piped water supply, it could be done through hand pumps.

D-5.2 The infrastructural services shall be provided before the plots are handed over to individual owners.

D-6 Site and Services Schemes (to be edited)

D-6.1 The developed plot sizes shall be as per D-2.3. Services would have to be laid by the Agency concerned as per the provisions of the Code. In so far as roads and pathways are concerned, they could also be in line with D-4.

D-6.2 Site and services schemes shall provide for the following:

a) the infrastructural needs for a permanent housing, depending upon requirements;

5.10 PRESERVATION OF NATURAL RESOURCES

5.10.1 Protection by area.

Where flood hazard areas, surface water bodies or wetlands, conservation areas, parklands, agricultural lands or greenfields are located on, or adjacent to, a plot, the development of the plot as a building site shall comply with the provisions of Clauses 5.10.2 through 5.10.7.

5.10.2. Flood hazard areas.

For locations within flood hazard areas, unless compliance with Clause 5.10.2.1 or Clause 5.10.2.2 is required by this Code new buildings and structures and substantial improvements shall comply with Clause 5.10.2.3.

5.10.2.1 Flood hazard area preservation, general.

Where this Clause is indicated to be applicable in this Code new buildings and structures, site disturbance, and development of land shall be prohibited within flood hazard areas.

5.10.2.2 Flood hazard area preservation, specific.

Where this Clause is indicated to be applicable in this Code new buildings and structures, site disturbance, and development of land shall be prohibited within the specific flood hazard areas established pursuant to local land use authority.

5.10.2.3 Development in flood hazard areas.

New buildings, structures and substantial improvements constructed in flood hazard areas shall be in compliance with this Code provided the lowest floors are elevated or dry floodproofed to not less than 25 mm (1 foot) above the elevation required by this Code, or the elevation established by the jurisdiction, whichever is higher.

5.10.3 Surface water protection.

Where this Clause is indicated to be applicable in this Code buildings and building site improvements shall not be located over, or
located within a buffer as established by the jurisdiction, around or adjacent to oceans, lakes, rivers, streams and other bodies of water that support or could support fish, recreation or industrial use. The buffer shall be measured from the ordinary high-water mark of the body of water.

Exceptions:

1. Buildings and associated site improvements specifically related to the use of the water including, but not limited to, piers, docks, fish hatcheries, and habitat restoration facilities, shall be permitted where the impacts of the construction and location adjacent to or over the water on the habitat is mitigated.

2. Buildings and associated site improvements shall be permitted where a wetlands permit has been issued under a national wetlands permitting program or otherwise issued by the authority having jurisdiction.

5.10.4 Wetland protection.
Buildings and building site improvements shall not be located within a wetland or within a buffer as established by the jurisdiction around a wetland.

Exception: Buildings and associated site improvements specifically related to the use of the wetland including, but not limited to, piers, docks, fish hatcheries, and habitat restoration facilities, shall be permitted where the impacts of the construction and location adjacent to or over the wetland on the habitat are mitigated.

5.10.5 Conservation area.
Where this Clause is indicated to be applicable in this Code site disturbance or development of land in or within 15240 mm (50 feet) of a designated conservation area shall not be permitted.

Exception: Buildings and associated site improvements located in or within 15240 mm (50 feet) of a conservation area shall be permitted where the building and associated site improvements serve a purpose related to the conservation area as determined by the authority that designated the conservation area.

5.10.6 Agricultural land.
Where this Clause is indicated to be applicable in this Code buildings and associated site improvements shall not be located on land zoned for agricultural purposes.

Exception: Buildings and associated site improvements shall be permitted to be located on agriculturally zoned land where the building serves an agriculturally related purpose, including, but not limited to, primary residence, farmhouse, migrant workers housing, farm produce storage, processing and shipping.

5.10.7 Greenfield sites.
Where this Clause is indicated to be applicable in this Code site disturbance or development shall not be permitted on greenfield sites.

Exception: The development of new buildings and associated site improvements shall be permitted on greenfield sites where the jurisdiction determines that adequate infrastructure exists, or will be provided, and where the sites comply with not less than one of the following:

1. The greenfield site is located within 0.4 km (1/4 mile) of developed residential land with an average density of not less than 8 dwelling units per acre (19.8 dwelling units per hectare).

2. The greenfield site is located within 0.8 km (1/2 mile) walking distance of not less than 7 diverse uses. The diverse uses shall include not less than one use from each of the following categories of diverse uses: retail, service, or community facility.

3. The greenfield site has access to transit service. The building on the building site shall be located in compliance with one of the following:

3.1. Within 0.4 km (1/4 mile) distance, measured over roads or designated walking surfaces, of not less than 5 diverse uses and within 0.8 km (1/2 mile) walking distance of not less than 7 diverse uses.
planned bus or streetcar stops.

3.2. Within 0.8 km \(\frac{1}{2}\) mile distance, measured over designated walking surfaces, of existing or planned rapid transit stops, light or heavy passenger rail stations, ferry terminals, or tram terminals.

4. The greenfield site is located adjacent to areas of existing development that have connectivity of not less than 35 interClauses per square kilometer (90 interClauses per square mile). Not less than 25 percent of the perimeter of the building site shall adjoin, or be directly across a street, public bikeway or pedestrian pathway from the qualifying area of existing development.

4.1. InterClauses included for determination of connectivity shall include the following:

4.1.1. InterClauses of public streets with other public streets;

4.1.2. InterClauses of public streets with bikeways and pedestrian pathways that are not part of a public street for motor vehicles; and

4.1.3. InterClauses of bikeways and pedestrian pathways that are not part of a public street for motor vehicles with other bikeways and pedestrian pathways that are not part of a public street for motor vehicles.

4.2. The following areas need not be included in the determination of connectivity:

4.2.1. Water bodies, including, but not limited to lakes and wetlands.

4.2.2. Parks larger than \(\frac{1}{2}\) acre \(2023 \text{ m}^2\), designated conservation areas and areas preserved from development by the jurisdiction or by the state or federal government.

4.2.3. Large facilities including, but not limited to airports, railroad yards, college and university campuses.

5.10.7.1 Site disturbance limits on greenfield sites.

For greenfield sites that are permitted to be developed, site disturbances shall be limited to the following areas:

1. Within 18 288 mm (40 feet) of the perimeter of the building;

2. Within 4572 mm (15 feet) of proposed surface walkways, roads, paved areas and utilities;

2. Within 7620 mm (25 feet) of constructed areas with permeable surfaces that require additional staging areas to limit compaction in the constructed areas.

5.11 STORMWATER MANAGEMENT

5.11.1 Stormwater management.

Stormwater management systems, including, but not limited to, infiltration, evapo-transpiration; rainwater harvest and runoff reuse; shall be provided and maintained on the building site.

5.11.1.1 Increased runoff.

Stormwater management systems shall address the increase in runoff that would occur resulting from development on the building site and shall either:

1. Manage rainfall onsite and size the management system to retain not less than the volume of a single storm that is equal to the 95th-percentile rainfall event as recorded by the National Climatic Data Center or other approved precipitation records and all smaller storms and maintain the predevelopment natural runoff; or

2. Maintain or restore the predevelopment stable, natural runoff hydrology of the site throughout the development or redevelopment process.
Postconstruction runoff rate, volume, and duration shall not exceed predevelopment rates. The stormwater management system design shall be based, in part, on a hydrologic analysis of the building site.

5.11.1.2 Adjoining plots and property.
The stormwater management system shall not redirect or concentrate off-site discharge that would cause increased erosion or other drainage related damage to adjoining plots or public property.

5.11.1.3 Brownfields.
Stormwater management systems on areas of brownfields where contamination is left in place shall not use infiltration. Stormwater management systems shall not penetrate, damage, or otherwise compromise remediation actions at the building site.

5.11.2 Coal tar sealants.
Coal tar sealants shall not be used in any application exposed to stormwater, wash waters, condensates, or any source of water that could convey coal tar sealants into soils, surface waters or groundwaters.

5.12 LANDSCAPE IRRIGATION AND OUTDOOR FOUNTAINS

5.12.1 Landscape irrigation systems.
Irrigation of exterior landscaping shall comply with Clauses 5.12.1.1 and 5.12.1.2.

5.12.1.1 Water for outdoor landscape irrigation.
Outdoor landscape irrigation systems shall be designed and installed to reduce potable water use by 50 percent from a calculated mid-summer baseline in accordance with Clause 5.12.1.2 or, where permitted by State regulation or local ordinances, the system shall be supplied by municipal reclaimed water or with alternate onsite nonpotable water complying with this Code.

    Exceptions: Potable water is permitted to be used as follows:

1. During the establishment phase of newly planted landscaping.
2. To irrigate food production.
3. To supplement nonpotable water irrigation of shade trees provided in accordance with Clause 5.16.2.3.
4. Potable water is permitted for landscape irrigation where approved by local ordinance or regulation.

5.12.1.2 Irrigation system design and installation.
Where in-ground irrigation systems are provided, the systems shall comply with all of the following:

1. The design and installation of outdoor irrigation systems shall be under the supervision of an irrigation professional accredited or certified by an appropriate local or national body.
2. Landscape irrigation systems shall not direct water onto building exterior surfaces, foundations, exterior paved surfaces or adjoining plots. Systems shall not generate runoff.
3. Where an irrigation control system is used, the system shall be one that regulates irrigation based on weather, climatological or soil moisture status data. The controller shall have integrated or separate sensors to suspend irrigation events during rainfall.
4. Irrigation zones shall be based on plant water needs with plants of similar need grouped together. Turfgrass shall not be grouped with other plantings on the same zone.
5. Microirrigation zones shall be equipped with pressure regulators that ensure zone pressure is not greater than 275.8 kPa (40 psi), filters, and flush end assemblies.
6. Irrigation sprinklers shall:

    6.1. Have nozzles with matched precipitation rates.
6.2. Be prohibited on landscape areas less than 1230 mm (4 feet) in any dimension.

6.3. Be prohibited on slopes greater than 1-unit vertical to 4 units horizontal (25-percent slope).

**Exception:** Where the application rate of the irrigation sprinklers is less than or equal to 12.7 mm (0.5 inches) per hour.

6.4. Be permitted for use on turfgrass and crop areas only excepting microsprays of a flow less than 45 gallons (170 liters) per hour.

6.5. If of the pop-up configuration, pop-up to a height of not less than 4 inches (101 mm).

6.6. Only be installed in zones composed exclusively of irrigation sprinklers and shall be designed to achieve a lower quarter distribution uniformity of not less than 0.65.

5.12.2 Outdoor ornamental fountains and water features.

Where available and approved for use by the authority having jurisdiction, alternate nonpotable onsite water sources complying with this Code shall be used for outdoor ornamental fountains and other water features constructed or installed on a building site. Where the fountain or water feature is the primary user of the building site's nonpotable water source, a potable makeup water connection is prohibited.

**Exception:** Outdoor ornamental fountains and water features are allowed to use potable water provided water is recirculated and there is not an automatic refill valve connection to a source of potable water, and provided that either:

1. The catch basin or reservoir is no greater than 379 L (100 gallons); or

2. Less than 1.86 m$^2$ (20 square feet) of water surface area is exposed.

5.12.2.1 Treatment.
The treatment required to maintain appropriate water quality shall be determined by the authority having jurisdiction.

5.12.2.2 Recirculation.
Outdoor ornamental fountains and water features shall be equipped to recirculate and reuse the supplied water.

5.12.2.3 Signage.
Signage in accordance with this Code shall be posted at each outdoor ornamental fountain and water feature where nonpotable water is used.

5.13 MANAGEMENT OF VEGETATION, SOILS AND EROSION CONTROL

5.13.1 Soil and water quality protection.
Soil and water quality shall be protected in accordance with Clause 5.13.1.1 through 5.13.1.6

5.13.1.1 Soil and water quality protection plan.
A soil and water quality protection plan shall be submitted by the owner or the owner's authorized agent and approved prior to construction. The protection plan shall address the following:

1. A soils map, site plan, or grading plan that indicates designated soil management areas for all site soils, including, but not limited to:
   1.1. Soils that will be retained in place and designated as vegetation and soil protection areas (VSPAs).
   1.2. Topsoils that will be stockpiled for future reuse and the locations for the stockpiles.
   1.3. Soils that will be disturbed during construction and plans to restore disturbed soils and underlying subsoils to soil reference conditions.
   1.4. Soils that will be restored and re-vegetated.
   1.5. Locations for all laydown and storage areas, parking areas, haul roads and construction vehicle access,
1. For temporary utilities and construction trailer locations.

1.6. Treatment details for each zone of soil that will be restored, including the type, source and expected volume of materials, including compost amendments, mulch and topsoil.

1.7. A narrative of the measures to be taken to ensure that areas not to be disturbed and areas of restored soils are protected from compaction by vehicle traffic or storage, erosion, and contamination until project completion.

2. A written erosion, sedimentation and pollutant control program for construction activities associated with the project. The program shall describe the best management practices (BMPs) to be employed including how the BMPs accomplish the following objectives:

2.1. Prevent loss of soil during construction due to stormwater runoff or wind erosion, including the protection of topsoil by stockpiling for reuse.

2.2. Prevent sedimentation of stormwater conveyances or receiving waters or other public infrastructure.

2.3. Prevent polluting the air with dust and particulate matter.

2.4. Prevent runoff and infiltration of other pollutants from construction site, including, but not limited to thermal pollution, concrete wash, fuels, solvents, hazardous chemical runoff, pH and pavement sealants. Ensure proper disposal of pollutants.

2.5. Protect from construction activities the designated vegetation and soil protection areas, flood hazard areas and other areas of vegetation that will remain on site.

3. A written periodic maintenance protocol for landscaping and stormwater management systems, including, but not limited to:

3.1. A schedule for periodic watering of new planting that reflects different water needs during the establishment phase of new plantings as well as after establishment. Where development of the building site changed the amount of water reaching the preserved natural resource areas, include appropriate measures for maintaining the natural areas.

3.2. A schedule for the use of fertilizers appropriate to the plants species, local climate and the preestablishment and post-establishment needs of the installed landscaping. Nonorganic fertilizers shall be discontinued following plant establishment.

3.3. A requirement for a visual inspection of the site after major precipitation events to evaluate systems performance and site impacts.

3.4. A schedule of maintenance activities of the stormwater management system including, but not limited to, cleaning of gutters, downspouts, inlets and outlets, removal of sediments from pretreatment sedimentation pits and wet detention ponds, vacuum sweeping followed by high-pressure hosing at porous pavement and removal of litter and debris.
3.5. A schedule of maintenance activities for landscaped areas including, but not limited to, the removal of dead or unhealthy vegetation; reseeding of turf areas; mowing of grass to a height that optimizes lawn health and retention of precipitation.

5.13.1.2 Topsoil protection.

Topsoil that could potentially be damaged by construction activities or equipment shall be removed from areas to be disturbed and stockpiled on the building site for future reuse on the building site or other approved location. Topsoil stockpiles shall be secured and protected throughout the project with temporary or permanent soil stabilization measures to prevent erosion or compaction.

### TABLE 5.13.1.2

5.13.1.3 Imported soils.

Topsoils or soil blends imported to a building site to serve as topsoil shall not be mined from the following locations:

1. Sites that are prime farmland, unique farmland, or farmland of statewide importance.
2. Greenfield sites where development is prohibited by Clause 5.10.7.

**Exception:** Soils shall be permitted to be imported from the locations in Items 1 and 2 where those soils are a byproduct of a building and building site development process provided that imported soils are reused for functions comparable to their original function.

5.13.1.4 Soil reuse and restoration.

Soils that are being placed on a building site shall be prepared and placed in a manner that establishes the ability of the soil to support the vegetation that has been retained and that will be planted. Soil reuse and restoration shall be in accordance with Clauses Clause 5.13.1.4.1 and 5.13.1.4.2

#### 5.13.1.4.1 Preparation.

Before placing stockpiled or imported topsoil, compliance with all of the following shall occur:

1. Areas shall be cleared of debris including, but not limited to, building materials, plaster, paints, road base type materials, petroleum based chemicals, and other harmful materials;
2. Areas of construction-compacted subsoil shall be scarified; and
3. The first lift of replaced soil shall be mixed into this scarification zone to improve the transition between the subsoil and overlying soil horizons.

**Exception:** Scarification is prohibited in the following locations:

1. Where scarification would damage existing tree roots.
2. On inaccessible slopes.
3. On or adjacent to trenching and drainage installations.
4. On areas intended by the design to be compacted such as abutments, footings, inslopes.
5. Brownfields.
6. Other locations where scarification would damage...
5.13.1.4.2 Restoration.
Soils disturbed during construction shall be restored in areas that will not be covered by buildings, structures or hardscapes. Soil restoration shall comply with the following:

1. Organic matter. To provide appropriate organic matter for plant growth and for water storage and infiltration, soils shall be amended with a mature, stable compost material so that not less than the top 305 mm (12 inches) of soil contains not less than 3 percent organic matter. Sphagnum peat or organic amendments that contain sphagnum peat shall not be used. Soil organic matter shall be determined in accordance with ASTM D2974. Organic materials selected for onsite amendment or for blending of imported soils shall be renewable within a 50-year cycle.

Exception: Where the reference soil for a building site has an organic level depth other than 305 mm (12 inches), soils shall be amended to organic matter levels and organic matter depth that are comparable to the site’s reference soil.

2. Additional soil restoration criteria. In addition to compliance with Item 1, soil restoration shall comply with not less than three of the following criteria:

2.1. Compaction. Bulk densities within the root zone shall not exceed the densities specified in Table 5.13.1.2 and shall be measured using a soil cone penetrometer in accordance with this Code. The root zone shall be not less than 305 mm (12 inches) nor less than the site’s reference soil, whichever results in the greater depth of measurement. Data derived from a soil cone penetrometer shall be reported in accordance with this Code.

2.2. Infiltration rates. Infiltration rates or saturated hydraulic conductivity of the restored soils shall be comparable to the site's reference soil. Infiltration rates shall be determined in accordance with ASTM D3385 or ASTM D5093. For sloped areas where the methods provided in the referenced standards cannot be used successfully, alternate methods approved by the Code official shall be permitted provided that the same method is used to test both reference soil and onsite soil.

2.3. Soil biological function. Where remediated soils are used, the biological function of the soils' mineralizable nitrogen shall be permitted as a proxy assessment of biological activity.

2.4. Soil chemical characteristics. Soil chemical characteristics appropriate for plant growth shall be restored. The pH, cation exchange capacity and nutrient profiles of the original undisturbed soil or the site’s reference soil shall be matched in restored soils. Salinity suitable for regionally appropriate vegetation shall be established. Soil amendments and fertilizers shall be selected from those that minimize nutrient loading to waterways or groundwater.

5.13.1.5 Engineered growing media.
Where engineered growing media are used onsite, including, but not limited to vegetative roofs, trees located within hardscape areas, and special soils specified for wetlands and environmental restoration sites, such media shall comply with the best available science and practice standards for that engineered growing media and use.

5.13.1.6 Documentation.
The following shall be provided to document compliance with Clauses 5.13.1.3 through 5.13.1.5

1. Documentation, such as receipts from a soil, compost and amendments supplier, to demonstrate that techniques to restore soil occurred; and

2. Soil test results to demonstrate that the selected techniques achieved the criteria of Clause 5.13.1.4.2. Not less than two soil tests shall be conducted on the building site. For building sites where more than 744 $m^2$ (8,000 square feet) of soil is to be disturbed during construction,
there shall be not less than one report for every 372 m² (4,000 square feet) disturbed or report frequency as determined by the registered design professional.

5.13.2 Vegetation and soil protection.

Vegetation and soils shall be protected in accordance with Clauses 5.13.2.1 and 5.13.2.2.

5.13.2.1 Vegetation and soil protection plan.

Where existing soils and vegetation are to be protected, a vegetation and soil protection plan establishing designated vegetation and soil protection areas (VSPAs) shall be submitted with the construction documents and other Submission documents. The protection plan shall address the following:

1. Identification of existing vegetation located on a building site that is to be preserved and protected.

2. Identification of portions of the building site to be designated as vegetation and soil protection areas (VSPAs) that are to be protected during the construction process from being affected by construction activities.

3. Specification of methods to be used such as temporary fencing or other physical barriers to maintain the protection of the designated vegetation and soil protection areas (VSPAs).

4. Specification of protected perimeters around trees and shrubs that are to be included in the designated vegetation and soil protection areas (VSPAs). Perimeters around trees shall be identified as a circle with a radius of not less than 305 mm (1 foot) for every 25 mm (inch) of tree diameter with a radius of not less than 1524 mm (5 feet). The perimeters around shrubs shall be not less than twice the radius of the shrub.

Exception: Approved alternative perimeters appropriate to the location and the species of the trees and shrubs shall be permitted.

5. Specification of methods to protect the viability of the designated vegetation and soil protection areas (VSPAs) to support the remaining vegetation at the conclusion of the construction process including minimizing impacts on the existing stormwater drainage patterns associated with the VSPAs.

6. Identification of plans, methods and practices used to designate essential areas of soil and subsoil disturbance.

5.13.2.1.1 Tree protection zones (TPZ).

Where tree protection zones are specified, the specifications and documentation shall be in accordance with this Code.

5.13.2.2 Invasive plant species.

Invasive plant species shall not be planted on a building site. A management plan for the containment, removal and replacement of any invasive plant species currently on the site shall be generated based on either published recommendation for the referenced invasive plant or guidance prepared by a qualified professional. Existing vegetation that is to be retained on a building site shall be protected as required by Clause 5.13.2.

5.13.3 Native plant landscaping.

Where new landscaping is installed as part of a site plan or within the building site, not less than 75 percent of the newly landscaped area shall be planted with native plant species.

5.14 BUILDING SITE WASTE MANAGEMENT

5.14.1 Building site waste management plan.

A building site waste management plan shall be developed and implemented to divert not less than 75 percent of the land-clearing debris and excavated soils from disposal. Land-clearing debris includes rock, trees, stumps and associated vegetation. The plan shall include provisions that address all of the following:

1. Materials to be diverted from disposal by efficient usage, recycling or reuse on the building site shall be specified.
2. Diverted materials shall not be sent to sites that are agricultural land, flood hazard areas or greenfield sites where development is prohibited by Clause 5.10.1 except where approved by the Code official.

3. The effective destruction and disposal of invasive plant species.

4. Where contaminated soils are removed, the methods of removal and location where the soils are to be treated and disposed.

5. The amount of materials to be diverted shall be specified and shall be calculated by weight or volume, but not both.

6. Where the site is located in a federal or state designated quarantine zone for invasive insect species, building site vegetation management shall comply with the quarantine rules.

7. Receipts or other documentation related to diversion shall be maintained through the course of construction. When requested by the Code official, evidence of diversion shall be provided.

5.14.2 Construction waste.
Construction materials and waste and hardscape materials removed during site preparation shall be managed in accordance with this Code.

5.15 TRANSPORTATION IMPACT

5.15.1 Walkways and bicycle paths.
Not less than one independent, paved walkway or bicycle path suitable for bicycles, strollers, pedestrians, and other forms of nonmotorized locomotion connecting a street or other path to a building entrance shall be provided. Walkways and bicycle paths shall connect to existing paths or sidewalks, and shall be designed to connect to any planned future paths. Paved walkways and bicycle paths shall be designed to minimize stormwater runoff. Pervious and permeable pavement shall be designed in accordance with Clause 5.16.2.4.

5.15.2 Changing and shower facilities.
Buildings with a total building floor area greater than 929 m² (10,000 square feet) and that are required to be provided with long-term bicycle parking and storage in accordance with Clause 5.15.3 shall be provided with onsite changing room and shower facilities. Not less than one shower shall be provided for each 20 long-term bicycle parking spaces, or fraction thereof.

Where more than one changing room and shower facility is required, separate facilities shall be provided for each sex.

5.15.3 Bicycle parking and storage.
Long-term and short-term bicycle parking shall be provided as specified in Table 5.15.3. The required number of spaces shall be determined based on the net floor area of each primary use or occupancy of a building except where Table 5.15.3 specifies otherwise. Accessory occupancy areas shall be included in the calculation of primary occupancy area.

Exceptions:

1. Long-term bicycle parking shall not be required where the total building floor area is less than 232 m² (2,500 square feet).

3. Subject to the approval of the Code official, the number of bicycle parking spaces shall be permitted to be reduced because of building site characteristics including, but not limited to, isolation from other development.

Other | Outdoor recreation, parks | 1 per 20 vehicle parking spaces; not less than 2 spaces | None

**NOTE:**

For SI: 1 square foot = 0.0929 m².

a. Requirements based on square feet shall be the net floor area of the occupancy or use.

b. When a calculation results in a fraction of space, the requirements shall be rounded to the next higher whole number.

5.15.3.1 Short-term bicycle parking.
Short-term bicycle parking shall comply with all of the following:

1. It shall be provided with illumination of not less than 11 lux (1 footcandle) at the parking surface;

2. It shall be located at the same grade as the sidewalk or at a location reachable by ramp or accessible route;

3. Horizontal parking spaces shall have a floor area of not less than 457 mm (18 inches) by 1829 mm (72 inches) for each bicycle;

4. Vertical parking spaces shall have a floor area of not less than 457 mm (18 inches) by 1118 mm (44 inches) for each bicycle with not less than 610 mm (24 inches) of clearance above the highest point of the bicycle rack;

5. It shall be provided with a rack or other facility for locking or securing each bicycle;

6. It shall be located within 30 480 mm (100 feet) of, and visible from, the main entrance.

**Exception:** Where directional signage is provided at the main building entrances, short-term bicycle parking shall be permitted to be provided at locations not visible from the main entrance.

5.15.3.2 Long-term bicycle parking.
Long-term bicycle parking shall comply with all of the following:

1. It shall be located on the same building site or within the building;

2. It shall be provided with illumination of not less than 1 footcandle (11 lux) at the parking surface;

3. Horizontal parking spaces shall have a floor area of not less than 18 inches (457 mm) by 72 inches (1829 mm) for each bicycle;

4. Vertical parking spaces shall have a floor area of not less than 18 inches (457 mm) by 44 inches (1118 mm) for each bicycle with not less than 24 inches (610 mm) of clearance above the highest point of the bicycle rack; and

5. It shall be provided with a rack or other facility for locking or securing each bicycle.

Not less than 50 percent of long-term bicycle parking shall be within a building or provided with a permanent cover including, but not limited to, roof overhangs, awnings, or bicycle storage lockers or within covered parking structures.

Vehicle parking spaces, other than those required by Clause 5.15, local zoning requirements and accessible parking required by the In this Code, shall be permitted to be used for the installation of long term bicycle parking spaces.

5.15.7.4 Preferred vehicle parking.

Where either Clause 5.15.4.1 or 5.15.4.2 is indicated to be applicable in this Code, parking provided at a building site shall comply with this Clause. Preferred parking spaces required by this Clause shall be those in the parking facility that are located on the shortest route of travel from the parking facility to a building entrance, but shall not take precedence over parking spaces that are required to be accessible in accordance with the In this Code. Where buildings have multiple entrances with adjacent parking, parking spaces required by this Clause shall be dispersed and located near the entrances. Such parking spaces shall be provided with approved signage that specifies the permitted usage.
5.15.4.1 High-occupancy vehicle parking.

Where employee parking is provided for a building that has a total building floor area greater than 929 m$^2$ (10,000 square feet), a building occupant load greater than 100 and not less than 20 employees, at least 5 percent, but not less than two, of the employee parking spaces provided shall be designated as preferred parking for high-occupancy vehicles.

5.15.4.2 Low-emission, hybrid, and electric vehicle parking.

Where parking is provided for a building that has a total building floor area greater than 929 m$^2$ (10,000 square feet) and that has a building occupant load greater than 100, at least 5 percent, but not less than two, of the parking spaces provided shall be designated as preferred parking for low emission, hybrid, and electric vehicles.

5.16 HEAT ISLAND MITIGATION

5.16.1 General.
The heat island effect of building and building site development shall be mitigated in accordance with Clause 5.16.2 and 5.16.3.

5.16.2 Site hardscape.
In climate zones 1 through 6, as established in this Code, not less than 50 percent of the site hardscape shall be provided with one or any combination of options described in Clauses 5.16.2.1 through 5.16.2.4. For the purposes of this Clause, site hardscape shall not include areas of the site covered by solar photovoltaic arrays or solar thermal collectors.

5.16.2.1 Site hardscape materials.
Hardscape materials shall have an initial solar reflectance value of not less than 0.30 in accordance with ASTM E1918 or ASTM C1549.

Exception: The following materials shall be deemed to comply with this Clause and need not be tested:
1. Pervious and permeable concrete pavements.
2. Concrete paving without added color or stain.

5.16.2.2 Shading by structures.
Where shading is provided by a building or structure or a building element or component, such building, structure, component or element shall comply with all of the following:

1. Where open trellis-type, free-standing structures such as, but not limited to, covered walkways, and trellises or pergolas, are covered with native plantings, the plantings shall be designed to achieve mature coverage within five years;
2. Where roofed structures are used to shade parking, those roofs shall comply with Clause 408.3 in climate zones 1 through 6; and
3. Shade provided onto the hardscape by an adjacent building or structure located on the same plot shall be calculated and credited toward compliance with this Clause based on the projected peak sun angle on the summer solstice.

5.16.2.3 Shading by trees.
Where shading is provided by trees, such trees shall be selected and placed in accordance with all of the following:

1. Trees selected shall be those that are native or adaptive to, the region and climate zone in which the project site is located. Invasive plant species shall not be selected. Plantings shall be selected and sited to produce a hardy and drought resistant vegetated area;
2. Construction documents shall be submitted that show the planting location and anticipated ten-year canopy growth of trees and that show the contributions of existing tree canopies; and
3. Shading calculations shall be shown on the construction documents demonstrating compliance with this Clause and shall include only those hardscape areas directly beneath the trees based on a ten-year growth canopy. Duplicate shading credit shall not be granted for those areas where multiple trees shade the same hardscape.
5.16.2.4 Pervious pavement and permeable unit pavement.

Pervious pavement and permeable unit pavement including open grid paving systems and open-graded aggregate systems shall have an infiltration rate not less than 2 gallons per minute per square foot (100 L/min × m²). The infiltration rate for pervious pavement shall be determined by testing in accordance with ASTM C1701/C1701M. The infiltration rate for permeable unit pavement shall be determined by testing in accordance with ASTM C1781/C1781M. Pervious pavement and permeable unit pavement shall be permitted where the use of these types of hardscapes does not interfere with fire and emergency apparatus or vehicle or personnel access and escape, utilities, or telecommunications lines. Aggregate used shall be open-graded to allow the pavement to comply with the infiltration rate.

5.16.3 Roof surfaces.

Not less than 75 percent of the roof surfaces of buildings and covered parking located in climate zones 1 through 3, as established in this Code, shall be a roof complying with Clause 5.16.3.1; shall be covered with a vegetative roof complying with Clause 4.8.3.2; or a combination of these requirements. The provisions of this Clause shall apply to roofs of structures providing shade to parking in accordance with Clause 5.16.2.2 where located in climate zones 1 through 6.

Exception: Portions of roof surfaces occupied by the following shall be permitted to be deducted from the roof surface area required to comply with this Clause:

- Solar thermal collectors.
- Solar photovoltaic systems.
- Roof penetrations and associated equipment.
- Portions of the roof used to capture heat for building energy technologies.
- Rooftop decks and rooftop walkways.
- Portions of roofs that are ballasted with a stone ballast of not less than 74 kg/m² (17 pounds per square foot) or 117 kg/m² (23 pounds per square foot) for pavers.

5.16.3.1 Roof coverings—solar reflectance and thermal emittance.

Where roof coverings are used for compliance with Clause 5.16.3, roof coverings shall comply with Clause 5.16.3.1.1 or 5.16.3.1.2. The values for solar reflectance and thermal emittance shall be determined by an independent laboratory accredited by a nationally recognized accreditation program. Roof products shall be listed and labeled and certified by the manufacturer demonstrating compliance.

5.16.3.1.1 Roof products testing.

Roof products shall be tested for not less than three-year aged solar reflectance in accordance with ASTM E1918, ASTM C1549 or the CRRC-1 Standard and thermal emittance in accordance with ASTM C1371, ASTM E408 or the CRRC-1 Standard, and shall comply with the minimum values in Table 5.16.3.1.

5.16.3.1.2 Solar reflectance index.

Roof products shall be permitted to use a solar reflectance index (SRI) where the calculated value is in compliance with this code values for minimum aged SRI. The SRI value shall be determined using ASTM E1980 with a convection coefficient of 2.1 Btu/h-ft² (12 W/m² × k) based on three-year aged roof samples.
tested in accordance with the test methods in Clause 5.16.3.1.1.

5.16.3.2 Vegetative roofs.
Vegetative roofs, where provided in accordance with Clause 5.16.3, shall comply with the following:

1. All plantings shall be selected based on their hardiness zone classifications in accordance with this Code and shall be capable of withstanding the climate conditions of the jurisdiction and the microclimate conditions of the building site including, but not limited to, wind, precipitation, and temperature. Planting density shall provide foliage coverage, in the warm months, of not less than 80 percent within two years of the date of installation unless a different time period is established in the approved design. Plants shall be distributed to meet the coverage requirements. Invasive plant species shall not be planted.

2. The soil medium shall be designed for the physical conditions and local climate to support the plants and shall consist of nonsynthetic materials. The planting design shall include measures to protect the engineered soil medium until the plants are established. Protection measures include, but are not limited to, installation of pregrown vegetated mats or modules, tackifying agents, fiber blankets and reinforcing mesh. The maximum wet weight and water holding capacity of a soil medium shall be determined in accordance with ASTM E2399.

3. Where access to the building facades is provided from locations on the perimeter of the roof, nonvegetated buffers adequate to support associated equipment and to protect the roof shall be provided.

4. Nonvegetated clearances as required for fire classification of vegetative roof systems shall be provided in accordance with the Ghana Fire Code.

5. Plantings shall be capable of being managed to maintain the function of the vegetative roof as provided in the documents required by Clause 10.3.1.

6. Installation of plantings shall be in accordance with the roof covering manufacturer’s installation instructions and shall not diminish the weather protective properties of the roof covering.

5.17 SITE LIGHTING

5.17.1 Light pollution control.
Where this Clause is indicated to be applicable in this Code uplight, light trespass, and glare shall be limited for all exterior lighting equipment as described in Clause 5.17.2 and 5.17.3.

Exception: Lighting used for the following exterior applications is exempt where equipped with a control device independent of the control of the nonexempt lighting:

1. Specialized signal, directional, and marker lighting associated with transportation.

2. Advertising signage or directional signage.

3. Lighting integral to equipment or instrumentation and installed by its manufacturer.

4. Theatrical purposes, including performance, stage, film production, and video production.

5. Athletic playing areas where lighting is equipped with hoods or louvers for glare control.

6. Temporary lighting.

7. Lighting for industrial production, material handling, transportation sites, and associated storage areas where lighting is equipped with hoods or louvers for glare control.

8. Theme elements in theme and amusement parks.

9. Roadway lighting required by governmental authorities.
10. Lighting used to highlight features of public monuments and registered landmark structures.

11. Lighting classified for and used in hazardous areas.

12. Lighting for swimming pools, spas and water features.

13. Lighting for the national flag in light pollution zones B, C and D.

5.17.1.1 Lighting pollution zones.
The light pollution zone for the building site shall be determined from Table 5.17.1.1 unless otherwise specified by the jurisdiction.

<table>

c. The rating shall be determined by the actual photometric geometry in the specified mounting orientation.
PART 6: GENERAL BUILDING HEIGHTS AND AREAS

User note:
About this part: Part 6 establishes the limits to which a building can be built. Building height, number of stories and building area are specified in this part. Part 6 must be used in conjunction with the occupancies established in Part 3 and the types of construction established in Part 7. This part also specifies the impact that mezzanines, accessory occupancies and mixed occupancies have on the overall size of a building.

6.1 GENERA

6.1 Scope.
The provisions of this part control the height and area of structures hereafter erected and additions to existing structures.

6.2 BUILDING ADDRESS

6.2.1 Address identification.
New and existing buildings shall be provided with approved address identification. An approved identification system such as the GhanaPostGPS street Address System must be used in the application for building permits. The address identification shall be legible and placed in a position that is visible from the street or road fronting the property. Address identification characters shall contrast with their background. Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall not be spelled out. Each character shall be a minimum of 102 mm (4 inches) high with a minimum stroke width of 12.7 mm (1/2 inch). Where required by the fire Code official, address identification shall be provided in additional approved locations to facilitate emergency response. Where access is by means of a private road and the building address cannot be viewed from the public way, a monument, pole or other approved sign or means shall be used to identify the structure. Address identification shall be maintained.

6.3 GENERAL BUILDING HEIGHT AND AREA LIMITATIONS

6.3.1 General.
Unless otherwise specifically modified in Part 4 and this part, building height, number of stories and building area shall not exceed the limits specified in Clause 6.4 and 6.9 based on the type of construction as determined by Clause 7.2 and the occupancies as determined by Clause 3.2 except as modified hereafter. Building height, number of stories and building area provisions shall be applied independently. For the purposes of determining area limitations, height limitations and type of construction, each portion of a building separated by one or more fire walls complying with Clause 8.6 shall be considered to be a separate building.

6.3.1.1 Special industrial occupancies.
Buildings and structures designed to house special industrial processes that require large areas and unusual building heights to accommodate craneways or special machinery and equipment, including, among others, rolling mills; structural metal fabrication shops and foundries; or the production and distribution of electric, gas or steam power, shall be exempt from the building height, number of stories and building area limitations specified in Clause 6.4 and 6.9.

6.3.1.2 Buildings on same plot.
Two or more buildings on the same plot shall be regulated as separate buildings or shall be considered as portions of one building where the building height, number of stories of each building and the aggregate building area of the buildings are within the limitations specified in Clause 6.4 and 6.9. The provisions of this Code applicable to the aggregate building shall be applicable to each building.

6.3.1.3 Type I construction.
Buildings of Type I construction permitted to be of unlimited tabular building heights and areas are not subject to the special requirements that allow unlimited area buildings in this Code or unlimited building height in Clauses 6.3.1.1 and 6.4.3 or increased building heights and areas for other types of construction.

6.3.1.4 Occupied roofs.
A roof level or portion thereof shall be permitted to be used as an occupied roof provided the
occupancy of the roof is an occupancy that is permitted by Table 6.4.4 for the storey immediately below the roof. The area of the occupied roofs shall not be included in the building area as regulated by Clause 6.9.

Exceptions:

1. The occupancy located on an occupied roof shall not be limited to the occupancies allowed on the storey immediately below the roof where the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 and occupant notification in accordance with Clause 10.7.5 is provided in the area of the occupied roof.

2. Assembly occupancies shall be permitted on roofs of open parking spaces of Type I or Type II construction, in accordance with the exception to Clause 10.3.2.1.6.

6.3.1.4.1 Enclosures over occupied roof areas.

Elements or structures enclosing the occupied roof areas shall not extend more than 1220 mm (48 inches) above the surface of the occupied roof.

Exception: Penthouses constructed in accordance with Clause 16.10.2 and towers, domes, spires and cupolas constructed in accordance with Clause 16.10.5.

6.4 BUILDING HEIGHT AND NUMBER OF STORIES

6.4.1 General.

The height, in feet, and the number of stories of a building shall be determined based on the type of construction, occupancy classification and whether there is an automatic sprinkler system installed throughout the building.

Exception: The building height of one-storey aircraft hangars, aircraft paint hangars and buildings used for the manufacturing of aircraft shall not be limited where the building is provided with an automatic sprinkler system or automatic fire-extinguishing system in accordance with Part 10 and is entirely surrounded by public ways or yards not less in width than one and one-half times the building height.

6.4.1.1 Unlimited area buildings.

The height of unlimited area buildings shall be designed in accordance with Clause 6.10.

6.4.1.2 Special provisions.

The special provisions of Clause 6.13 permit the use of special conditions that are exempt from, or modify, the specific requirements of this part regarding the allowable heights of buildings based on the occupancy classification and type of construction, provided the special condition complies with the provisions specified in Clause 6.13.

6.4.2 Mixed occupancy.

In a building containing mixed occupancies in accordance with Clause 6.11, no individual occupancy shall exceed the height and number of storey limits specified in this clause for the applicable occupancies.

6.4.3 Height in feet.

The maximum height, in feet, of a building shall not exceed the limits specified in Table 6.4.3.

Exception: Towers, spires, steeples and other roof structures shall be constructed of materials consistent with the required type of construction of the building except where other construction is permitted by Clause 16.10.2.4. Such structures shall not be used for habitation or storage. The structures shall be unlimited in height where of non-combustible materials and shall not extend more than 6096 mm (20 feet) above the allowable building height where of combustible materials (Part 16 for additional requirements).

For SI: 1 foot = 304.8 mm.
UL = Unlimited; NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.33.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.33.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.33.1.3.

a. See Parts 4 and 5 for specific exceptions to the allowable height in this part.
b. See Clause 10.32 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.32.5.
d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.32.6. For new Group I-1 occupancies Condition 1, see Exception 1 of Clause 10.32.6.
f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.32.6 and the Ghana Fire Code.
g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Clause 10.32.6.
h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.32.8.

### 6.4.4 Number of stories.

The maximum number of stories of a building shall not exceed the limits specified in Table 6.4.4.

UL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1.; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.2.; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.3.

a. See Parts 5 and 6 for specific exceptions to the allowable height in this part.

b. See Clause 10.3.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.

c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.3.2.5.

d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.

e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.3.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Clause 10.3.2.6.

f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.3.2.6 and the Ghana Fire Code.

g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Clause 10.3.2.6.

h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.3.2.8

#### 6.5 AREA AND HEIGHT LIMITATIONS

**6.5.1 General**

The limitation of area and height of buildings of different occupancy classes and types of construction shall be achieved by specifying it in terms of FAR (or FSI), which shall take into account the various aspects that govern in specifying FAR as given below:

- Occupancy class;
- Types of construction;
- Width of street fronting the building and the traffic load;
- Locality where the building is proposed and the density;
- Parking facilities;
- Local fire fighting facilities; and
- Water supply and drainage facilities.

**6.5.2** The comparative FAR's for different occupancies and types of construction are as given in Table 6.5.1 and the Authority shall select a basic FAR for one occupancy and a type of construction and arrive at the FAR values for other combinations taking into account the other local factors see 6.5.1.
6.5.2.1 Unlimited Areas

The minimum fire separation on all sides of buildings of unlimited areas (see Table 6.5.1) and of Type 1 construction shall be 9m.

6.5.3 Street Width

The area limits shall apply to all buildings fronting on a street or public space not less than 9m in width accessible to a public street.

6.5.4 Height Limit

The height and number of storeys shall be related to FAR and the provisions of this Code.

6.5.4.1 Where a building height is not covered by Table 6.5.1, the maximum height shall be limited according to the width of the street as follows:

a) the maximum height of building shall not exceed 1.5 times the width of road abutting plus the front open space;

b) if a building abuts on two or more streets of different widths, the building shall be deemed to face upon the street that has the greater width and the height of the building shall be regulated by the width of that street and may be continued to this height to a depth of 24m along the narrower street subject to conformity of this Code and

c) for buildings in the vicinity of aerodromes, provisions of Clause 6.5.5 shall apply.

6.5.4.2 Height Exceptions

6.5.4.2.1 Roof Structures

The following appurtenant structures shall not be included in the height of the building unless the aggregate area of such structures, including pent-houses, exceeds one-third of the area of the roof of building upon which they are erected:

a) roofs tanks and their supports;
b) ventilating, air-conditioning, lift rooms and similar service equipment;
c) roof structures other than pent-houses; and
d) chimneys and parapet walls not exceeding 1m in height.

<td>2.8</td>
</tr>
</tbody>
</table>
UL – Unlimited  
NP – Not Permitted

Note 1 – This table has been prepared, taking into account the combustible content in the different occupancies as well as the fire resistance offered by the type of construction (see Part 3 Use and Occupancy).

Note 2 – This table shall be modified by the Authority, taking into account the other aspects as given below (see 6.5.1).

   a)  density in terms of dwelling units/hectare;  
   b)  traffic considerations; 
   c)  parking spaces;  
   d)  local fire fighting facilities; and 
   e)  water supply, drainage and sanitation requirements.

Note 3 – The FAR specified may be increased by 20 percent for the following:

   a) a basement or cellar and space under a building constructed on stilts and used as a parking space, and air-conditioning plant room used as accessory to the principal use;
   b) electric cabin or substation, watchman’s booth of maximum size of 1.6m² with minimum width or diameter of 1.2m, pump house, garbage shaft, space required for location of fire hydrants, electric fittings and water tank;  
   c) projections and accessory buildings as specifically exempted; and  
   d) staircase room and lift rooms above the topmost storey, architectural features; and chimneys and elevated tanks of dimensions as permissible under the Code, the area of the lift shaft shall be taken only on one floor.

Note 4 – In so far as single storey storage and hazardous occupancies are concerned, they would be further governed by volume to plot area ratio (VPR), to be decided by the Authority.

6.5.4.2.2 Except in buildings where automatic sprinkler system is a requirement in accordance with Part 3 Use and Occupancy, all structures of Type 1, Type 2 and Type 3 construction designed for industrial, business, mercantile, low or moderate hazard storage occupancies may be erected 6m higher than specified in Table 6.5.1 when equipped with an approved one-source automatic sprinkler system.

6.5.5 Restrictions in the vicinity of Aerodromes

6.5.5.1 For buildings in the vicinity of aerodromes, the maximum height of such buildings shall be decided in consultation with the Ghana Civil Aviation Authority. This shall be regulated by the rules for giving no objection certificate for construction of buildings in the vicinity of aerodromes by the Director General of Civil Aviation, which are given in Appendix A. However, the latest rules of the Ghana Civil Aviation Authority shall be followed in all cases of buildings coming up in the vicinity of an aerodrome.

6.5.5.1.1 For the purpose of 6.5.5.1, new buildings structures which rise to 30m or more in height and are to be located within 20 km of the aerodrome reference point, shall be constructed only if a no objection certificate has been obtained from the Director General of Civil Aviation.

6.5.5.1.2 In the case of buildings to be erected in the vicinity of defence aerodromes, the maximum height of such buildings shall be decided by the Defence Authority.

6.5.5.2 This will apply specially to new constructions, overhead HT/LT lines, telephone/telegraph lines, factories, chimneys, wire/TV antennas.

6.5.5.2.1 No new chimneys or smoke producing factories shall be constructed within a radius of 8 km from the aerodrome reference point (ARP).

6.5.5.2.2 Overhead HT/LT lines or telephone/telegraph lines shall not be permitted in the approach/take-off climb areas within 3000m of the inner edge of these areas.

6.5.5.2.3 A 3m margin shall be allowed in new constructions for wireless/TV antennas and cooling towers.

6.5.5.3 Butcheries, tanneries and solid waste disposal sites shall not be permitted within 10 km from the aerodrome reference point.

6.5.6 Group Housing

6.5.6.1 Group housing development may normally and preferably be in multi storeyed blocks; it shall not be a customary subdivision of land into streets and plots.

6.5.6.2 No limit to floors and height shall be applicable, but the coverage and floor area
ratio for various densities may be as given in Table 6.5.2 unless otherwise provided in the Master Plan and local development control rules.

Table 6.5.2 - Floor Area Ratio and Coverage for Group Housing

</table>

Note – The coverage shall be calculated on the basis of the whole area reserved for group housing after deducting:

a) the area of any highway, any road up to 25m and major residential roads of 18m width around the group housing area (residential street, loop street, cul-de-sac, service lanes and footpaths shall not be deducted);

b) the area of school (excluding sites for nursery schools) and other community facilities within the group housing area; and

c) the open spaces, except playgrounds of local nature.

6.6 REQUIREMENTS OF PARTS OF BUILDINGS

6.6.1 Plinth

6.6.1.1 Main Buildings

The plinth or any part of a building or outhouse shall be so located with respect to the surrounding ground level that adequate drainage of the site is assured. The height of the plinth shall be not less than 450mm from the surrounding ground level.

6.6.1.2 Interior Courtyards

Every interior courtyard shall be raised at least 150mm above the level of the centre of the nearest street and shall be satisfactorily drained.

6.6.2 Habitable Rooms

6.6.2.1 Height

The height of all rooms for human habitation shall not be less than 2.75m measured from the surface of the floor to the lowest point of the ceiling (bottom of slab). In the case of pitched roof, the average height of rooms shall not be less than 2.75m. The minimum clear head room under a beam, folded plates or eaves shall be 2.4m. In the case of air-conditioned rooms, a height of not less than 2.4m measured from the surface of the floor to the lowest point of air-conditioning duct or the false ceiling shall be provided.

6.6.2.1.1 The requirements of 6.6.2.1 apply to residential, business and mercantile buildings. For educational and industrial buildings, the following minimum requirements apply:

<table>
<thead>
<tr>
<th>a) Educational buildings</th>
<th>Ceiling height 3.6m for all regions</th>
</tr>
</thead>
<tbody>
<tr>
<td>b) Industrial buildings</td>
<td>Ceiling height 3.6m, except when air-conditioned, 3m (Factory Act 1948 and rules therein shall govern such heights, where applicable).</td>
</tr>
</tbody>
</table>

6.6.2.2 Size

The area of habitable room shall not be less than 9.5m², where there is only one room with a minimum width of 2.4m. Where there are two rooms, one of these shall not be less than 9.5m² and the other not less than 7.5m², with a minimum width of 2.1m.

6.6.3 Kitchen

6.6.3.1 Height

The height of a kitchen measured from the surface of the floor to the lowest point in the ceiling (bottom slab) shall not be less than 2.75m, except for the portion to accommodate floor trap of the upper floor.
6.6.3.2 Size

The area of a kitchen where separate dining area is provided, shall be not less than 5.0m² with a minimum width of 1.8m. Where there is a separate store, the area of the kitchen may be reduced to 4.5m². A kitchen, which is intended for use as a dining area also, shall have a floor area of not less than 7.5m² with a minimum width of 2.1m.

6.6.3.3 Other Requirements

Every room to be used as kitchen shall have:

a) unless separately provided in a pantry, means of the washing of kitchen utensils which shall lead directly or through a sink to a grated and trapped connection to the waste pipe;

b) an impermeable floor;

c) a flue, if found necessary; and

d) a window or ventilator or opening of size not less than as specified in this Code, subject to increase in area of opening in accordance with Note 3 of this Code.

6.6.4 Bathrooms and Water-Closets

6.6.4.1 Height

The height of a bathroom or water-closet measured from the surface of the floor to the lowest point in the ceiling (bottom of slab) shall not be less than 2m.

6.6.4.2 Size

The size of a bathroom shall not be less than 1.5 x 1.2m or 1.8m². The floor area of water-closet shall be 1.1m² with a minimum width of 0.9m. If bath and water-closet are combined, its floor area shall not be less than 2.8m² with a minimum width of 1.2m.

6.6.4.3 Other Requirements

Every bathroom or water-closet shall:

a) be so situated that at least one of its walls shall open to external air;

b) not be directly over or under any room other than another water-closet, washing place, bath or terrace, unless it has a water-tight floor;

c) have the platform or seat made of water-tight non-absorbent material;

d) be enclosed by walls or partitions and the surface of every such wall per partition shall be finished with a smooth impervious material to a height of not less than 1m above the floor of such a room;

e) be provided with an impervious floor covering, sloping towards the drain with a suitable grade and not towards verandah or any other room; and

f) have a window or ventilator, opening to a shaft or open space, of area not less than 0.3m² with side not less than 0.3m.

6.6.4.4 No room containing water-closets shall be used for any purpose except as a lavatory and no such room shall open directly into any kitchen or cooking space by a door, window or other opening. Every room containing water-closet shall have a door completely closing the entrance to it.

6.6.5 Ledge or Loft

6.6.5.1 Height

It shall have a minimum head-room of 2.2m.

6.6.5.2 Size

A ledge in a habitable room shall not cover more than 25 percent of the area of the floor on which it is constructed and shall not interfere with the ventilation of the room under any circumstances.

6.6.5.3 Loft

The maximum height of loft shall be 1.5m. A loft, if provided, on a kitchen, shall not exceed 25 percent of the area of the kitchen, leaving minimum headroom of 2.2m for the kitchen under the loft. On bathroom, water-closet and corridor, the loft can be 100 percent.

6.6.6 Mezzanine floor

6.6.6.1 Height

It shall have a minimum height of 2.2m.
6.6.6.2 Size
The minimum size of the mezzanine floor, if it is to be used as a living room, shall not be less than 9.5m². The aggregate area of such mezzanine floor in a building shall in no case exceed one-third the plinth area of the building.

6.6.6.3 Other Requirements
A mezzanine floor may be permitted over a room or a compartment provided:

a) it conforms to the standards of living rooms as regards lighting and ventilation in case the size of mezzanine floor is 9.5m² or more
b) it is so constructed as not to interfere under any circumstances with the ventilation of the space over and under it;
c) such mezzanine floor is not subdivided into smaller compartments;
d) such mezzanine floor or any part of it shall not be used as a kitchen; and
e) in no case shall a mezzanine floor be closed so as to make it liable to be converted into unventilated compartments.

6.6.7 Store Room

6.6.7.1 Height
The height of a store room shall be not less than 2.2m.

6.6.7.2 Size
The size of a store room, where provided in a residential building, shall be not less than 3m.

6.6.8 Garage

6.6.8.1 Height
The height of a garage shall not be less than 2.4m.

6.6.8.2 Size
The size of garages shall be as below:

a) Private garage – 2.5 x 5.0m, minimum; and
b) Public garage – based on the number of vehicles parked, etc.

6.6.9 Basement

6.6.9.1 The basement shall not be used for residential purposes.

6.6.9.2 The construction of the basement shall be allowed by the authority in accordance with the land use and other provisions specified under the Development Control Rules.

6.6.9.2.1 The basement to be constructed within the prescribed set-backs and prescribed building lines and subject to maximum coverage on floor 1 (entrance floor) may be put to only the following uses:

a) storage of household or other goods of ordinarily combustible material;
b) strong rooms, bank cellars, etc.
c) air-conditioning equipment and other machines used for services and utilities of the building; and
d) parking spaces.

6.6.9.3 The basement shall have the following requirements.

a) Every basement shall be in every part at least 2.4m in height from the floor to the underside of the roof slab or ceiling.

b) Adequate ventilation shall be provided for the basement. The ventilation requirements shall be the same as required by the particular occupancy according to byelaws. Any deficiency may be met by providing adequate mechanical ventilation in the form of blowers, exhaust fans, air-conditioning systems, etc.

c) The minimum height of the ceiling of any basement shall be 0.9m and the maximum,
1.2m above the average surrounding ground level.

d) Adequate arrangements shall be made such that surface drainage does not enter the basement.

e) The walls and floors of the basement shall be watertight and be so designed that the effects of the surrounding soil and moisture, if any, are taken into account in design and adequate damp proofing treatment is given.

f) The access to the basement shall be separated from the main and alternative staircase providing access and exit from higher floors. Where the staircase is continuous in the case of buildings served by more than one staircase, the same shall be of enclosed type serving as a fire separation from the basement floor and higher floors. Open ramps shall be permitted if they are constructed within the building line subject to the provision of (d).

6.6.10 Chimneys

The chimneys shall be built at least 0.9m above flat roofs, provided the top of the chimney is not below the top of the adjacent parapet wall. In the case of sloping roofs, the chimney top shall not be less than 0.6m above the ridge of the roof in which the chimney penetrates.

6.6.11 Parapet

Parapet walls and handrails provided on the edges of roof terraces, balcony, verandah, etc. shall not be less than 1.05m and not more than 1.20m in height from the finished floor level.

6.6.12 Cabin

The size of cabins shall not be less than 3.0m$^2$. The clear passages within the divided space of any floor shall not be less than 0.75m and the distance from the farthest space in a cabin to any exit shall not be more than 18.5m. In case the subdivided cabin does not derive direct lighting and ventilation from any open spaces/mechanical means, the maximum height of the cabin shall be 2.2m.

6.6.13 Boundary Wall

6.6.13.1 The requirements of the boundary wall are given below:

a) Except with the special permission of the Authority, the maximum height of the compound wall shall be 1.5m above the centre line of the front street. Compound walls up to 2.5m height may be permitted if the top 0.9m is of open type construction of a design to be approved by the Authority.

b) In the case of a corner plot, the height of the boundary wall shall be restricted to 0.75m for a length of 10m on the front and side of the interclauses and the balance height of 0.75m if required in accordance with (a) may be made up of open type construction (through railings, breeze blocks etc.) and of design to be approved by the Authority.

c) However, the provisions of (a) and (b) are not applicable to boundary walls of jails. In industrial buildings, electric substations, transformer stations, institutional buildings like sanitoria, hospitals, industrial buildings like workshops, factories and educational buildings like schools, colleges, including hostels and other uses of public utility undertakings, heights up to 2.4m may be permitted by the Authority.

6.6.14 Wells

Wells, intended to supply water for human consumption or domestic purposes, where provided, shall comply with the requirements of 6.6.14.1 and 6.6.14.2.
6.6.14.1 Location

The well shall be located:

a) not less than 15m from any ash pit, refuse pit, earth closet or privy and shall be located on a site upwards from the earth closet or privy;

b) not less than 18m from any cesspit soakaway or borehole latrine and shall be located on a site upwards from the earth closet or privy;

c) that contamination by the movement of sub-soil or other water is unlikely; and

d) not under a tree or otherwise it should have a canopy over it, so that leaves and twigs may not fall into the well and rot.

6.6.14.2 Requirements

The well shall:

a) have a minimum internal diameter of not less than 1m;

b) be constructed to a height not less than 1m above the surrounding ground level, to form a parapet or kerb and to prevent surface water from flowing into well, and shall be surrounded with a paving constructed of impervious material which shall extend for a distance of not less than 1.8m in every direction from the parapet from the kerb forming the well head and the upper surface of such a paving shall be sloped away from the well;

c) be of sound and permanent construction throughout. Temporary or exposed wells shall be permitted only in fields or gardens for purposes of irrigation; and

d) have the interior surface of the lining or walls of the well rendered impervious for a depth of not less than 1.8m measured from the level of the ground immediately adjoining the well-head.

6.6.15 Septic Tanks

Where a septic tank is used for sewage disposal, the location, design and construction of the septic tank shall conform to requirements of 6.6.15.1 and 6.6.15.2.

6.6.15.1 Location of Septic Tanks and Subsurface Absorption Systems

A subsoil dispersion system shall not be closer than 18m from any source of drinking water, such as well, to mitigate the possibility of bacterial pollution of water supply. It shall also be far removed from the nearest habitable building as economically feasible but not closer than 6m, to avoid damage to the structures.

6.6.15.2 Requirements

a) Dimensions of Septic Tanks – Septic tanks shall have a minimum width of 750mm, a minimum depth of 1 m below the water level and a minimum liquid capacity of 1m³. The length of tanks shall be 2 to 4 times the width.

b) Septic tanks may be constructed of brickwork, stone masonry, concrete or other suitable materials as approved by the Authority.

c) Under no circumstances shall effluent from a septic tank be allowed into an open channel drain or body of water without adequate treatment.

d) The minimum nominal diameter of the pipe shall be 100 mm. Further, at junctions of pipes in manholes, direction of flow from a branch connection shall not make an angle exceeding 45° with the direction of flow in the main pipe;

e) The gradients of land drains, under-drainage as well as the bottom of dispersion trenches and soakaways shall be between 1:300 and 1:400;

f) Every septic tank shall be provided with ventilating pipe of at least 50
mm diameter. The top of the pipe shall be provided with a suitable cage of mosquito-proof wire mesh;

The ventilating pipe shall extend to a height which would cause no smell nuisance to any building in the area. Generally, the ventilating pipe may extend to a height of about 2m, when the septic tank is at least 15 m away from the nearest building and to a height of 2m above the top of the building when it is located closer than 15m;

g) When the disposal of septic tank effluent is to a seepage pit, the seepage pit may be of any suitable shape with the least cross-clausal dimension of 900mm and not less than 1000mm in depth below the invert level of the inlet pipe. The pit may be lined with stone, brick or concrete blocks with dry open joints which should be backed with at least 75mm of clean coarse aggregate. The lining above the inlet level should be finished with mortar. In the case of pits of large dimensions, the top portion may be narrowed to reduce the size of the RCC cover slabs. Where no lining is used, especially near trees, the entire pit should be filled with stones. A masonry ring may be constructed at the top of the pit to prevent damage by flooding of the pit by surface runoff. The inlet pipe may be taken down a depth of 900mm from the top as an anti-mosquito measure; and

h) When the disposal of the septic tank effluent is to a dispersion trench, the dispersion trench shall be 500 to 1000mm deep and 300 to 1000mm wide excavated to a slight gradient and shall be provided with 150 to 250mm of washed gravel or crushed stones. Open jointed pipes placed inside the trench shall be made of unglazed earthenware clay or concrete and shall have a minimum internal diameter of 75 to 100 mm. Each dispersion trench shall not be longer than 30m and trenches shall not be placed closer than 1.8 m.

6.6.16 Office-cum-Letter Box Room

In the case of multi-storeyed, multi-family dwelling apartments constructed by existing and proposed Real Estate or Apartment Owners Associations, Limited companies and proposed housing societies, an office-cum-letter box room of dimension 3.6 x 3m shall be provided on the ground floor. In case the number of flats is more than 20, the maximum size of the office-cum-letter box room shall be 20 m².

6.6.16.1 Business Building

Provision shall be made for letter boxes on the entrance floor as per the requirements of the postal department.

6.6.17 Meter Rooms

For all buildings above 15m in height and in special occupancies, like educational, assembly, institutional, industrial, storage, hazardous and mixed occupancies with any of the aforesaid occupancies having area more than 500 m² on each floor, provision shall be made for an independent and ventilated meter (service) room, as per requirements of electric (service) supply undertakings on the ground floor with direct access from outside for the purpose of termination of electric supply form the licensee’s service and alternative supply cables. The door/doors provided for the service room shall have fire resistance of not less than two hours.

6.6.18 Staircase

6.6.18.1 The minimum clear width, minimum tread width and maximum riser of staircases for buildings shall be as given in 6.6.18.1 to 6.6.18.1.3 (See also Part 3 Use and Occupancy).

6.6.18.1.1 Minimum Width

The minimum width of staircase shall be as follows:

<table>
<thead>
<tr>
<th>Type</th>
<th>Minimum Width</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Residential</td>
<td>1.0m</td>
</tr>
<tr>
<td>buildings (dwellings)</td>
<td></td>
</tr>
<tr>
<td>Note – For row</td>
<td></td>
</tr>
<tr>
<td>housing with 2 storeys, the minimum width shall be 0.75m</td>
<td></td>
</tr>
<tr>
<td>b) Residential</td>
<td>1.5m</td>
</tr>
<tr>
<td>hotel buildings</td>
<td></td>
</tr>
</tbody>
</table>
c) Assembly buildings like auditoria, theatres and cinemas 1.5m

d) Educational building up to 24m in height 1.5m

e) Institutional buildings up to 10 beds and more than 10 beds 2.0m

f) All other buildings 1.5m

6.6.18.1.2 Minimum Tread

The minimum width of tread without nosing shall be 250mm for residential buildings. The minimum width of tread for other buildings shall be 300mm.

6.6.18.1.3 Maximum Riser

The maximum height of riser shall be 190mm for residential buildings and 150mm for other buildings and these shall be limited to 15 per flight.

6.6.18.2 Minimum headroom

The minimum head-room in a passage under the landing of a staircase shall any staircase shall be 2.2m.

6.6.19 Roofs

6.6.19.1 The roof of a building shall be so constructed or framed as to permit effectual drainage of the rain-water therefrom by means of sufficient rain-water pipes of adequate size, wherever required, so arranged, jointed and fixed as to ensure that the rain-water is carried away from the building without causing dampness in any part of the walls or foundations of the building or those of an adjacent building.

6.6.19.2 The Authority may require rain-water pipes to be connected to a drain or sewer to a covered channel formed beneath the public footpath to connect the rain-water pipe to the road gutter or in any other approved manner.

6.6.19.3 Rain-water pipes shall be affixed to the outside of the external walls of the building or in recesses or chases cut on formed in such external walls or in such other manner as may be approved by the Authority.

6.6.20 Special requirements of low income housing shall be as given in Appendix D. For detailed information in this regard, reference may be made this Code.

6.6.21 Special requirements for the physically handicapped

- The special requirements for planning of buildings keeping in view the needs of the physical handicapped, applicable particularly to public buildings meant for their use, are given in Appendix E.

6.7 RODENT-PROOFING AND TERMITE-PROOFING OF BUILDINGS

6.7.1 Every building or part thereof that is designed or intended for use as a dwelling or for the handling, storage or sale of foodstuffs shall conform to the requirements as given in 6.7.2 and 6.7.3.

6.7.2 Every such building unless supported on posts shall have continuous foundation walls, extending from at least 600mm below ground level to at least 150mm above ground level or shall have a continuous floor of masonry or reinforced concrete or other equally effective rat-proof materials.

6.7.3 All openings in such foundations or floors, windows and drains, and all junctions between foundation walls and building walls shall be effectively rat-proofed, that is, windows and doors shall be tight fitting, and other openings shall be securely covered with rat-proof screening or grillage or shall be tightly closed with metal sheeting, concrete or other equally effective rat-proof material.

6.7.4 Termite control in buildings is very important, as the damage likely to be caused by termites to wooden structures of buildings and other household articles like furniture, clothing, stationery, etc. is considerable. Anti-termite measures in buildings shall be taken in accordance with this Code.
APPENDIX A

CIVIL AVIATION REQUIREMENTS FOR CONSTRUCTION IN THE VICINITY OF AN AERODROME

A-0 GENERAL

A-0.1 For the purpose of this Appendix, the following definitions shall apply.

A-0.1.1 Aerodrome Reference Point (ARP)

This is a designated point, which is established in the horizontal plane at or near the geometric centre of the landing area.

A-0.1.2 Approach Funnel

See Fig.A.1

A-0.1.3 Elevation or Reduced Level

This is the vertical distance of a point or a level, on or affixed to the surface of the earth, measured from the mean sea level.

A-0.1.4 Transitional Area

It is an area which is below a specified surface sloping upwards and outwards from the edge of the approach funnel and from a line originating at the end of the inner edge of each approach area, drawn parallel to the runway centre line in the direction of landing (See Fig. A.1).

A-1 PROHIBITED AREA

A-1.1 No building or structure shall be constructed or erected, or no tree shall be planted, on any land within the limits specified in A-1.2 and A-1.3 in respect of the aerodromes listed by the Ghana Civil Aviation Authority.

A-1.2 For the Aerodromes listed by the Ghana Civil Aviation Authority

These requirements shall be applicable for the land enclosed in approach funnels of the runway with a maximum distance of 360m measured from each runway and along the extend centre line of the runway. For the purpose of this clause, the requirements of approach funnel and an instrument runway shall be given in A-1.2.1 to A-1.2.3.

A-1.2.1 Approach funnel in the case of an instrument runway means the area in the shape of an isosceles trapezium having the longer parallel side 4800m long (2400m on either side of the extended centre line of the runway) and smaller parallel side 300m long (150m on either side of the extended centre line of the runway) where the smaller and longer parallel sides are placed at a distance of 60m and 15060m, respectively, from the end of the runway and at right angles to the extended centre line.
1B - Instrument Runway

All Dimensions are in Metres

A-1.2.2 In the case of a non-instrument runway, the approach funnel means the area in the shape of an isosceles trapezium having the longer parallel side 1800m long (900 m on either side of the extended centre line of the runway) and smaller parallel side 180m long (90m on either side of the extended centre line of the runway), where the smaller and longer parallel sides are placed at a distance of 60m and 6540m, respectively, from the end of the centre line. Thereafter, the trapezium is followed by a contiguous rectangular area of that width for the remainder of the length up to a distance of 15060m from the end of the runway.

A-1.2.3 An instrument runway is a runway served by visual and non-visual aid or aids providing at least directional guidance adequate for a straight in approach and intended for the operation of aircraft using instrument approach procedures.

A-2 HEIGHT RESTRICTION

A-2.1 For the aerodromes listed by the Ghana Civil Aviation Authority

No building or structure higher than the height specified in Tables 4.5 and 4.6 shall be constructed or erected, or no tree which is likely to grow or ordinarily grows higher than the height specified in the Tables 4.5 and 4.6, shall be planted, on any land within a radius of 20 km from ARP of the aerodromes listed in A-3, excluding the land covered by A-1.2.

</table>

**A.2.1.1** Table 4.5 gives the height restriction with respect to approach funnels and shall be applicable for the land enclosed in the approach funnels of all runways where distances are measured from each end of the runway, along extended centre line of the runway.

**A.2.1.2** Table 4.6 gives height restriction with respect to transitional area and shall be applicable for the land enclosed in the transitional area of all runways at an aerodrome listed in A-3 where distances are measured from the associated approach funnels, forming the inner boundary of the transitional area and along a line at right angles to the centre line of the runway.

### A-3 AERODROMES

**A-3.1** A list of aerodromes indicating runway directions, runway and elevations and ARP elevations is given in this Code.

### 6.8 MEZZANINES AND EQUIPMENT PLATFORMS

**6.8.1 General.**

Mezzanines shall comply with Clause 6.8.2. Equipment platforms shall comply with Clause 6.8.3.

**6.8.2 Mezzanines.**

A mezzanine or mezzanines in compliance with Clause 6.8.2 shall be considered a portion of the storey below. Such mezzanines shall not contribute to either the building area or number of stories as regulated by Clause 6.3.1. The area of the mezzanine shall be included in determining the fire area. The clear height above and below the mezzanine floor construction shall be not less than 2134 mm (7 feet).

**6.8.2.1 Area limitation.**

The aggregate area of a mezzanine or mezzanines within a room shall be not greater than one-third of the floor area of that room or space in which they are located. The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the mezzanine is located. In determining the allowable mezzanine area, the area of the mezzanine shall not be included in the floor area of the room.

**Exceptions:**

1. The aggregate area of mezzanines in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Clause 6.3.1.1 shall be not
greater than two-thirds of the floor area of the room.

2. The aggregate area of mezzanines in buildings and structures of Type I or II construction shall be not greater than one-half of the floor area of the room in buildings and structures equipped throughout with an approved automatic sprinkler system in accordance with Clause 10.3.3.1.1 and an approved emergency voice/alarm communication system in accordance with Clause 10.7.5.2.2.

3. The aggregate area of a mezzanine within a dwelling unit that is located in a building equipped throughout with an approved automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 shall not be greater than one-half of the floor area of the room, provided that:

   3.1. Except for enclosed closets and bathrooms, the mezzanine shall be open to the room in which such mezzanine is located;

   3.2. The opening to the room shall be unobstructed except for walls not more than 1067 mm (42 inches) in height, columns and posts; and

   3.3. Exceptions to Clause 6.8.2.3 shall not be permitted.

6.8.2.1.1 Aggregate area of mezzanines and equipment platforms.

Where a room contains both a mezzanine and an equipment platform, the aggregate area of the two raised floor levels shall be not greater than two-thirds of the floor area of that room or space in which they are located. The area of the mezzanine shall not exceed the area determined in accordance with Clause 6.8.2.1.

6.8.2.2 Means of escape.

The means of escape for mezzanines shall comply with the applicable provisions of Part 11.

6.8.2.3 Openness.

A mezzanine shall be open and unobstructed to the room in which such mezzanine is located except for walls not more than 1067 mm (42 inches) in height, columns and posts.

Exceptions:

1. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the occupant load of the aggregate area of the enclosed space is not greater than 10.

2. A mezzanine having two or more exits or access to exits is not required to be open to the room in which the mezzanine is located.

3. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the aggregate floor area of the enclosed space is not greater than 10 percent of the mezzanine area.

4. In industrial facilities, mezzanines used for control equipment are permitted to be glazed on all sides.

5. In occupancies other than Groups H and I, which are no more than two stories above grade plane and equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, a mezzanine having two or more exits or access to exits shall not be required to be open to the room in which the mezzanine is located.

6.8.3 Equipment platforms.

Equipment platforms in buildings shall not be considered as a portion of the floor below. Such equipment platforms shall not contribute to either the building area or the number of stories.
6.8.3.1 Area limitation.

The aggregate area of all equipment platforms within a room shall be not greater than two-thirds of the area of the room in which they are located. Where an equipment platform is located in the same room as a mezzanine, the area of the mezzanine shall be determined by Clause 6.8.2.1 and the combined aggregate area of the equipment platforms and mezzanines shall be not greater than two-thirds of the room in which they are located. The area of the mezzanine shall not exceed the area determined in accordance with Clause 6.8.2.1.

6.8.3.2 Automatic sprinkler system.

Where located in a building that is required to be protected by an automatic sprinkler system, equipment platforms shall be fully protected by sprinklers above and below the platform, where required by the standards referenced in Clause 10.3.3.

6.8.3.3 Guards.

Equipment platforms shall have guards where required by Clause 11.15.2.

6.9 BUILDING AREA

6.9.1 General.

The floor area of a building shall be determined based on the type of construction, occupancy classification, whether there is an automatic sprinkler system installed throughout the building and the amount of building frontage on public way or open space.

6.9.1.1 Unlimited area buildings.

Unlimited area buildings shall be designed in accordance with Clause 6.10.

6.9.1.2 Special provisions.

The special provisions of Clause 6.13 permit the use of special conditions that are exempt from, or modify, the specific requirements of this part regarding the allowable areas of buildings based on the occupancy classification and type of construction, provided the special condition complies with the provisions specified in Clause 6.13.

6.9.1.3 Basements.

Basements need not be included in the total allowable floor area of a building provided the total area of such basements does not exceed the area permitted for a one-storey above grade plane building.

6.9.2 Allowable area determination.

The allowable area of a building shall be determined in accordance with the applicable provisions of Clause 6.9.2.1 through 6.9.2.4 and clause 6.9.3.

</tbody>
</table>
UL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one storey above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1; SM = Buildings two or more stories above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.3.

a. See Parts 4 and 5 for specific exceptions to the allowable height in this part.
b. See Clause 10.3.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.3.2.
d. The NS value is only for use in evaluation of existing building area in accordance with the International Existing Building Code.
e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.3.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Clause 10.3.2.6.
f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.3.2.6 and the Ghana Fire Code.
g. New Group I-4 occupancies see Exceptions 2 and 3 of Clause 10.3.2.6.
h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Clause 10.3.2.8.
i. The maximum allowable area for a single-storey nonsprinklered Group U greenhouse is permitted to be 9,000 square feet, or the allowable area shall be permitted to comply with Table C102.1 of Appendix C.

6.9.2.1 Single-occupancy, one-storey buildings.

The allowable area of a single-occupancy building with no more than one storey above grade plane shall be determined in accordance with Equation 6-1:

\[
A_a = A_t + (\text{NS} \times I_f)
\]

* (Equation 6-1)

Where:

\[A_a\] = Allowable area (square feet).
\[A_t\] = Tabular allowable area factor (NS, S1, S13R or S13D value, as applicable) in accordance with Table 6.9.2.
\[\text{NS}\] = Tabular allowable area factor in accordance with Table 6.9.2 for nonsprinklered building (regardless of whether the building is sprinklered).
\[I_f\] = Area factor increase due to frontage (percent) as calculated in accordance with Clause 6.9.3.

6.9.2.2 Mixed-occupancy, one-storey buildings.

The allowable area of a mixed-occupancy building with no more than one storey above grade plane shall be determined in accordance with the applicable provisions of Clause 6.11.1 based on Equation 6-1 for each applicable occupancy.

6.9.2.2.1 Group H-2 or H-3 mixed occupancies.

For a building containing Group H-2 or H-3 occupancies, the allowable area shall be determined in accordance with Clause 6.11.4.2, with the sprinkler system increase applicable only to the portions of the building not classified as Group H-2 or H-3.

6.9.2.3 Single-occupancy, multistorey buildings.

The allowable area of a single-occupancy building with more than one storey above grade plane shall be determined in accordance with Equation 6-2:

\[
A_a = [A_t + (\text{NS} \times I_f) \times S_a]
\]

* (Equation 6-2)

Where:

\[A_a\] = Allowable area (square feet).
\[A_t\] = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 6.9.2.
\[\text{NS}\] = Tabular allowable area factor in accordance with Table 6.9.2 for nonsprinklered building (regardless of whether the building is sprinklered).
\[I_f\] = Area factor increase due to frontage (percent) as calculated in accordance with Clause 6.9.3.
\[S_a\] = Actual number of building stories above grade plane.

No individual storey shall exceed the allowable area (\(A_a\)) as determined by Equation 6-2 using the value of \(S_a = 1\).

6.9.2.4 Mixed-occupancy, multistorey buildings.

Each storey of a mixed-occupancy building with more than one storey above grade plane shall individually comply with the applicable
requirements of Clause 6.11.1. For buildings with more than three stories above grade plane, the total building area shall be such that the aggregate sum of the ratios of the actual area of each storey divided by the allowable area of such stories, determined in accordance with Equation 5-3 based on the applicable provisions of Clause 6.11.1, shall not exceed three.

$$A_r = [A_a + (NS 	imes I_f)]$$
(Equation 6-3)

Where:
- $A_a$ = Allowable area (square feet).
- $A_t$ = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 6.92 for a nonsprinklered building (regardless of whether the building is sprinklered).
- $NS$ = Tabular allowable area factor in accordance with Table 6.92 for a nonsprinklered building (regardless of whether the building is sprinklered).
- $I_f$ = Area factor increase due to frontage (percent) as calculated in accordance with Clause 6.93.

Exception: For buildings designed as separated occupancies under Clause 6.11.4 and equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.33.1.2, the total building area shall be such that the aggregate sum of the ratios of the actual area of each storey divided by the allowable area of such stories determined in accordance with Equation 6-3 based on the applicable provisions of Clause 6.11.1, shall not exceed four.

### 6.9.3 Frontage increase.

Every building shall adjoin or have access to a public way to receive an area factor increase based on frontage. Area factor increase shall be determined in accordance with Clauses 6.93.1 through 6.93.3.

#### 6.9.3.1 Minimum percentage of perimeter.

To qualify for an area factor increase based on frontage, a building shall have not less than 25 percent of its perimeter on a public way or open space. Such open space shall be either on the same plot or dedicated for public use and shall be accessed from a street or approved fire lane.

#### 6.9.3.2 Minimum frontage distance.

To qualify for an area factor increase based on frontage, the public way or open space adjacent to the building perimeter shall have a minimum distance ($W$) of 20 feet (6096 mm) cleared of any obstructions from the building face to any of the following:

1. The closest interior line of a street, alley or public way.
2. The exterior face of an adjacent building on the same property.
3. The exterior face of an adjacent building on the same property.

Where the value of $W$ is greater than 9144 mm (30 feet), a value of 9144 mm (30 feet) shall be used in calculating the building area increase based on frontage, regardless of the actual width of the public way or open space. Where the value of $W$ varies along the perimeter of the building, the calculation performed in accordance with Equation 6-5 shall be based on the weighted average calculated in accordance with Equation 6-4.

$$W = (L_1 \times w_1 + L_2 \times w_2 + \ldots + L_n \times w_n)F$$
(Equation 6-4)

Where:
- $W$ = (Width: weighted average) = Calculated width of perimeter.
- $L_n$ = Length of a portion of the exterior perimeter wall.
- $w_n$ = Width (≥20 feet) of a public way or open space adjacent to the exterior perimeter wall.
- $F$ = Building perimeter that fronts on a public way or other open space (20 feet) or more.

Exception: Where a building meets the requirements of Clause 6.10, as applicable, except for compliance with the minimum 18 288 mm (60-foot) public way or yard requirement, and the value of $W$ is greater than 9144 mm (30 feet), the value of $W$ shall not exceed 18 288 mm (60 feet).
6.9.3.3 Amount of increase.

The area factor increase based on frontage shall be determined in accordance with Equation 6-5:

\[ I_f = \frac{[F/P - 0.25]W}{30} \]

6.10 UNLIMITED AREA BUILDINGS

6.10.1 General.

The area of buildings of the occupancies and configurations specified in Clauses 6.10.1 through 6.10.13 shall not be limited. Basements not more than one storey below grade plane shall be permitted.

6.10.1.1 Accessory occupancies.

Accessory occupancies shall be permitted in unlimited area buildings in accordance with the provisions of Clause 6.11.2, otherwise the requirements of Clause 6.10.3 through 6.10.13 shall be applied, where applicable.

6.10.2 Measurement of open spaces.

Where Clause 6.10.3 through 6.10.13 requires buildings to be surrounded and adjoined by public ways and yards, those open spaces shall be determined as follows:

1. Yards shall be measured from the building perimeter in all directions to the closest interior plot lines or to the exterior face of an opposing building located on the same plot, as applicable.

2. Where the building fronts on a public way, the entire width of the public way shall be used.

6.10.2.1 Reduced open space.

The public ways or yards of 18 288 mm (60 feet) in width required in Clauses 6.10.3, 6.10.4, 6.10.5, 6.10.6 and 6.10.12 shall be permitted to be reduced to not less than 12 192 mm (40 feet) in width provided all of the following requirements are met:

1. The reduced width shall not be allowed for more than 75 percent of the perimeter of the building.

2. The exterior walls facing the reduced width shall have a fire-resistance rating of not less than 3 hours.

3. Openings in the exterior walls facing the reduced width shall have opening protectives with a fire protection rating of not less than 3 hours.

6.10.3 Nonsprinklered, one-storey buildings.

The area of a Group F-2 or S-2 building not more than one storey in height shall not be limited where the building is surrounded and adjoined by public ways or yards not less than 18 288 mm (60 feet) in width.

6.10.4 Sprinklered, one-storey buildings.

The area of a Group A-4 building not more than one storey above grade plane of other than Type V construction, or the area of a Group B, F, M or S building not more than one storey above grade plane of any construction type, shall not be limited where the building is provided with an automatic sprinkler system throughout in accordance with Clause 10.33.1.1 and is surrounded and adjoined by public ways or yards not less than 18 288 mm (60 feet) in width.

Exceptions:

1. Buildings and structures of Type I or II construction for rack storage facilities that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Clauses 6.10.4 and 10.33.1.1 and the Ghana Fire Code.

2. The automatic sprinkler system shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4,
provided that all of the following criteria are met:

2.1. Exit doors directly to the outside are provided for occupants of the participant sports areas.

2.2. The building is equipped with a fire alarm system with manual fire alarm boxes installed in accordance with Clause 10.7.

2.3. An automatic sprinkler system is provided in storage rooms, press boxes, concession booths or other spaces ancillary to the sport activity space.

6.10.4.1 Mixed occupancy buildings with Groups A-1 and A-2.

Group A-1 and A-2 occupancies of other than Type IV construction shall be permitted within mixed occupancy buildings of unlimited area complying with Clause 6.10.4, provided all of the following criteria are met:

1. Group A-1 and A-2 occupancies are separated from other occupancies as required for separated occupancies in Clause 6.11.4.4 with no reduction allowed in the fire-resistance rating of the separation based upon the installation of an automatic sprinkler system.

2. Each area of the portions of the building used for Group A-1 or A-2 occupancies shall not exceed the maximum allowable area permitted for such occupancies in Clause 6.3.1.

3. Exit doors from Group A-1 and A-2 occupancies shall discharge directly to the exterior of the building.

6.10.5 Two-storey buildings.

The area of a Group B, F, M or S building not more than two stories above grade plane shall not be limited where the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.33.1.1 and is surrounded and adjoined by public ways or yards not less than 18 288 mm (60 feet) in width.

6.10.6 Group A-3 buildings of Type II construction.

The area of a Group A-3 building not more than one storey above grade plane, used as a place of religious worship, community hall, dance hall, exhibition hall, gymnasium, lecture hall, indoor swimming pool or tennis court of Type II construction, shall not be limited provided all of the following criteria are met:

1. The building shall not have a stage other than a platform.

2. The building shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.33.1.1.

3. The building shall be surrounded and adjoined by public ways or yards not less than 18 288 mm (60 feet) in width.

6.10.7 Group A-3 buildings of Type III and IV construction.

The area of a Group A-3 building of Type III or IV construction, with not more than one storey above grade plane and used as a place of religious worship, community hall, dance hall, exhibition hall, gymnasium, lecture hall, indoor swimming pool or tennis court, shall not be limited provided all of the following criteria are met:

1. The building shall not have a stage other than a platform.

2. The building shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.33.1.1.

3. The assembly floor shall be located at or within 533 mm (21 inches) of street or grade level and all exits are provided with ramps complying with Clause 11.12 to the street or grade level.

4. The building shall be surrounded and adjoined by public ways or yards not less than 18 288 mm (60 feet) in width.
6.10.8 Group H-2, H-3 and H-4 occupancies.

Group H-2, H-3 and H-4 occupancies shall be permitted in unlimited area buildings containing Group F or S occupancies in accordance with Clauses 6.10.4 and 6.10.5 and the provisions of Clauses 6.10.8.1 through 6.10.8.4.

6.10.8.1 Allowable area.

The aggregate floor area of Group H occupancies located in an unlimited area building shall not exceed 10 percent of the area of the building or the area limitations for the Group H occupancies as specified in Clause 6.9 based on the perimeter of each Group H floor area that fronts on a public way or open space.

6.10.8.1.1 Located within the building.

The aggregate floor area of Group H occupancies not located at the perimeter of the building shall not exceed 25 percent of the area limitations for the Group H occupancies as specified in Clause 6.9.

6.10.8.1.1.1 Liquid use, dispensing and mixing rooms.

Liquid use, dispensing and mixing rooms having a floor area of not more than 46.5 m² (500 square feet) need not be located on the outer perimeter of the building where they are in accordance with the Ghana Fire Code.

6.10.8.1.2 Liquid storage rooms.

Liquid storage rooms having a floor area of not more than 93 m² (1,000 square feet) need not be located on the outer perimeter where they are in accordance with the Ghana Fire Code.

6.10.8.1.3 Spray paint booths.

Spray paint booths that comply with the Ghana Fire Code need not be located on the outer perimeter.

6.10.8.2 Located on building perimeter.

Except as provided for in Clause 6.10.8.1.1, Group H occupancies shall be located on the perimeter of the building. In Group H-2 and H-3 occupancies, not less than 25 percent of the perimeter of such occupancies shall be an exterior wall.

6.10.8.3 Occupancy separations.

Group H occupancies shall be separated from the remainder of the unlimited area building and from each other in accordance with Table 6.11.4.

6.10.8.4 Height limitations.

For two-storey, unlimited area buildings, Group H occupancies shall not be located more than one storey above grade plane unless permitted based on the allowable height and number of stories and feet as specified in Clause 6.4 based on the type of construction of the unlimited area building.

6.10.9 Unlimited mixed occupancy buildings with Group H-5.

The area of a Group B, F, H-5, M or S building not more than two stories above grade plane shall not be limited where the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.33.1.1, and is surrounded and adjoined by public ways or yards not less than 18 288 mm (60 feet) in width, provided all of the following criteria are met:

1. Buildings containing Group H-5 occupancy shall be of Type I or II construction.

2. Each area used for Group H-5 occupancy shall be separated from other occupancies as required in Clause 4.15.11 and 6.11.4.

3. Each area used for Group H-5 occupancy shall not exceed the maximum allowable area permitted for such occupancies in Clause 6.3.1 including modifications of Clause 6.9

Exception: Where the Group H-5 occupancy exceeds the maximum allowable area, the Group H-5 shall be subdivided into areas that are separated by 2-hour fire barriers.

6.10.10 Aircraft paint hangar.

The area of a Group H-2 aircraft paint hangar not more than one storey above grade plane shall not be limited where such aircraft paint hangar complies with the provisions of Clause
4.12.5 and is surrounded and adjoined by public ways or yards not less in width than one and one-half times the building height.

6.10.11 Group E buildings.

The area of a Group E building not more than one storey above grade plane, of Type II, IIIA or IV construction, shall not be limited provided all of the following criteria are met:

1. Each classroom shall have not less than two means of escape, with one of the means of escape being a direct exit to the outside of the building complying with Clause 11.22.
2. The building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.33.1.1.
3. The building is surrounded and adjoined by public ways or yards not less than 18 288 mm (60 feet) in width.

6.10.12 Motion picture theaters.

In buildings of Type II construction, the area of a motion picture theater located on the first storey above grade plane shall not be limited where the building is provided with an automatic sprinkler system throughout in accordance with Clause 10.33.1.1 and is surrounded and adjoined by public ways or yards not less than 18 288 mm (60 feet) in width.

6.10.13 Covered and open mall buildings and anchor buildings.

The area of covered and open mall buildings and anchor buildings not exceeding three stories in height that comply with Clause 4.2 shall not be limited.

6.11 MIXED USE AND OCCUPANCY

6.11.1 General.

Each portion of a building shall be individually classified in accordance with Clause 3.2.1. Where a building contains more than one occupancy group, the building or portion thereof shall comply with the applicable provisions of Clause 6.11.2, 6.11.3 or 6.11.4, or a combination of these clauses.

Exceptions:

1. Occupancies separated in accordance with Clause 6.13.
2. Where required by Table 4.15.6.2, areas of Group H-1, H-2 and H-3 occupancies shall be located in a detached building or structure.
3. Uses within live/work units, complying with Clause 4.19, are not considered separate occupancies.

6.11.2 Accessory occupancies.

Accessory occupancies are those occupancies that are ancillary to the main occupancy of the building or portion thereof. Accessory occupancies shall comply with the provisions of Clauses 6.11.2.1 through 6.11.2.4.

6.11.2.1 Occupancy classification.

Accessory occupancies shall be individually classified in accordance with Clause 3.2.1. The requirements of this Code shall apply to each portion of the building based on the occupancy classification of that space.

6.11.2.2 Allowable building height.

The allowable height and number of stories of the building containing accessory occupancies shall be in accordance with Clause 6.4 for the main occupancy of the building.

6.11.2.3 Allowable building area.

The allowable area of the building shall be based on the applicable provisions of Clause 6.9 for the main occupancy of the building. Aggregate accessory occupancies shall not occupy more than 10 percent of the floor area of the storey in which they are located and shall not exceed the tabular values for nonsprinklered buildings in Table 6.92 for each such accessory occupancy.

6.11.2.4 Separation of occupancies.

No separation is required between accessory occupancies and the main occupancy.

Exceptions:
1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Clause 508.4.

2. Group I-1, R-1, R-2 and R-3 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from accessory occupancies contiguous to them in accordance with the requirements of Clause 4.20.

6.11.3 Nonseparated occupancies.

Buildings or portions of buildings that comply with the provisions of this clause shall be considered as nonseparated occupancies.

6.11.3.1 Occupancy classification.

Nonseparated occupancies shall be individually classified in accordance with Clause 3.2.1. The requirements of this Code shall apply to each portion of the building based on the occupancy classification of that space. In addition, the most restrictive provisions of Part 10 that apply to the nonseparated occupancies shall apply to the total nonseparated occupancy area.

6.11.3.1.1 High-rise buildings.

Where nonseparated occupancies occur in a high-rise building, the most restrictive requirements of Clause 4.3 that apply to the nonseparated occupancies shall apply throughout the high-rise building.

6.11.3.2 Group I-2, Condition 2 occupancies.

Where one of the nonseparated occupancies is Group I-2, Condition 2, the most restrictive requirements of Clause 4.7 and 6.12 and 8.12 shall apply throughout the fire area containing the Group I-2 occupancy. The most restrictive requirements of Part 11 shall apply to the path of escape from the Group I-2, Condition 2 occupancy up to and including the exit discharge.

6.11.3.2 Allowable building area, height and number of stories.

The allowable building area, height and number of stories of the building or portion thereof shall be based on the most restrictive allowances for the occupancy groups under consideration for the type of construction of the building in accordance with Clause 5.3.1.

6.11.3.3 Separation.

No separation is required between nonseparated occupancies.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Clause 6.11.4.

2. Group I-1, R-1, R-2 and R-3 dwelling units and sleeping units shall be separated from other dwelling or sleeping units and from other occupancies contiguous to them in accordance with the requirements of Clause 4.20.

6.11.4 Separated occupancies.

Buildings or portions of buildings that comply with the provisions of this clause shall be considered as separated occupancies.

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.33.1.1.
NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.33.1.1.
N = No separation requirement.
NP = Not Required.

6.11.4.1 Occupancy classification.

Separated occupancies shall be individually classified in accordance with Clause 3.2.1. Each separated space shall comply with this Code based on the occupancy classification of that portion of the building. The most restrictive provisions of Part 10 that apply to the separate occupancies shall apply to the total nonfire-barrier-separated occupancy area. Occupancy separations that serve to define fire area limits established in Part 10 for requiring fire protection systems shall also comply with this Code.

6.11.4.3 Allowable building height and number of stories.

Each separated occupancy shall comply with the building height limitations and storey limitations based on the type of construction of the building in accordance with Clause 6.3.1.

**Exception:** Special provisions of Clause 6.13 shall permit occupancies at building heights and number of stories other than provided in Clause 6.3.1.

6.11.4.4 Separation.

Individual occupancies shall be separated from adjacent occupancies in accordance with Table 6.11.4.

6.11.4.4.1 Construction.

Required separations shall be fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both, so as to completely separate adjacent occupancies.
6.12 INCIDENTAL USES

6.12.1 General
Incidental uses located within single occupancy or mixed occupancy buildings shall comply with the provisions of this clause. Incidental uses are ancillary functions associated with a given occupancy that generally pose a greater level of risk to that occupancy and are limited to those uses listed in Table 6.12.

Exception: Incidental uses within and serving a dwelling unit are not required to comply with this clause.

6.12.2 Occupancy classification.
Incidental uses shall not be individually classified in accordance with Clause 3.2.1. Incidental uses shall be included in the building occupancies within which they are located.

6.12.3 Area limitations.
Incidental uses shall not occupy more than 10 percent of the building area of the storey in which they are located.

6.12.4 Separation and protection.
The incidental uses listed in Table 6.12 shall be separated from the remainder of the building or equipped with an automatic sprinkler system, or both, in accordance with the provisions of that table.

6.12.4.1 Separation.
Where Table 6.12 specifies a fire-resistance-rated separation, the incidental uses shall be separated from the remainder of the building by a fire barrier constructed in accordance with Clause 8.7 or a horizontal assembly constructed in accordance with Clause 8.11, or both. Construction supporting 1-hour fire barriers or horizontal assemblies used for incidental use separations in buildings of Type IB, IIB and IVB construction is not required to be fire-resistance rated unless required by other clauses of this Code.

6.12.4.2 Protection.
Where Table 6.12 permits an automatic sprinkler system without a fire barrier, the incidental uses shall be separated from the

For SI: 1 square foot = 0.0929 m², 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m³.
remainder of the building by construction capable of resisting the passage of smoke. The walls shall extend from the top of the foundation or floor assembly below to the underside of the ceiling that is a component of a fire-resistance-rated floor assembly or roof assembly above or to the underside of the floor or roof sheathing, deck or slab above. Doors shall be self- or automatic-closing upon detection of smoke in accordance with Clause 8.16.2.6.6. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with the Ghana Fire Code. Walls surrounding the incidental use shall not have air transfer openings unless provided with smoke dampers in accordance with Clause 8.10.8.

6.12.4.2.1 Protection limitation.
Where an automatic sprinkler system is provided in accordance with Table 6.12, only the space occupied by the incidental use need be equipped with such a system.

6.13 SPECIAL PROVISIONS

6.13.1 General.
The provisions in Clauses 6.13.2 through 6.13.9 shall permit the use of special conditions that are exempt from, or modify, the specific requirements of this part regarding the allowable building heights and areas of buildings based on the occupancy classification and type of construction, provided the special condition complies with the provisions specified in this clause for such condition and other applicable requirements of this Code. The provisions of Clauses 6.13.2 through 6.13.8 are to be considered independent and separate from each other.

6.13.2 Horizontal building separation allowance.
A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of fire walls, limitation of number of stories and type of construction where all of the following conditions are met:

1. The buildings are separated with a horizontal assembly having a fire-resistance rating of not less than 3 hours. Where vertical offsets are provided as part of a horizontal assembly, the vertical offset and the structure supporting the vertical offset shall have a fire-resistance rating of not less than 3 hours.

2. The building below, including the horizontal assembly, is of Type IA construction.

3. Shaft, stairway, ramp and escalator enclosures through the horizontal assembly shall have not less than a 2-hour fire-resistance rating with opening protective in accordance with Clause 8.16.

Exception: Where the enclosure walls below the horizontal assembly have not less than a 3-hour fire-resistance rating with opening protective in accordance with Clause 8.16, the enclosure walls extending above the horizontal assembly shall be permitted to have a 1-hour fire-resistance rating, provided:

1. The building above the horizontal assembly is not required to be of Type I construction;

2. The enclosure connects fewer than four stories; and

3. The enclosure opening protective above the horizontal assembly have a fire protection rating of not less than 1 hour.

4. The building or buildings above the horizontal assembly shall be permitted to have multiple Group A occupancy uses, each with an occupant load of less 300, or Group B, M, R or S occupancies.

5. The building below the horizontal assembly shall be protected throughout by an approved automatic sprinkler system in accordance with Clause 10.33.1.1, and shall be permitted to be any occupancy allowed by this Code except Group H.

6. The maximum building height in mm (feet) shall not exceed the limits set forth in Clause 6.4.3 for the building having the smaller allowable height as measured from the grade plane.
6.13.3 Group S-2 enclosed parking garage with Group S-2 open parking garage above.

A Group S-2 enclosed parking garage with not more than one storey above grade plane and located below a Group S-2 open parking garage shall be classified as a separate and distinct building for the purpose of determining the type of construction where all of the following conditions are met:

1. The allowable area of the building shall be such that the sum of the ratios of the actual area divided by the allowable area for each separate occupancy shall not exceed 1.

2. The Group S-2 enclosed parking garage is of Type I or II construction and is at least equal to the fire-resistance requirements of the Group S-2 open parking garage.

3. The height and the number of tiers of the Group S-2 open parking garage shall be limited as specified in Table 4.6.5.4.

4. The floor assembly separating the Group S-2 enclosed parking garage and Group S-2 open parking garage shall be protected as required for the floor assembly of the Group S-2 enclosed parking garage. Openings between the Group S-2 enclosed parking garage and Group S-2 open parking garage, except exit openings, shall not be required to be protected.

5. The Group S-2 enclosed parking garage is used exclusively for the parking or storage of private motor vehicles, but shall be permitted to contain an office, waiting room and toilet room having a total area of not more than $93 \text{ m}^2$ (1,000 square feet) and mechanical equipment rooms incidental to the operation of the building.

6.13.4 Parking beneath Group R.

Where a maximum one storey above grade plane Group S-2 parking garage, enclosed or open, or combination thereof, of Type I construction or open of Type IV construction, with grade entrance, is provided under a building of Group R, the number of stories to be used in determining the minimum type of construction shall be measured from the floor above such a parking area. The floor assembly between the parking garage and the Group R above shall comply with the type of construction required for the parking garage and shall also provide a fire-resistance rating not less than the mixed occupancy separation required in Clause 6.11.4.

6.13.5 Group R-1 and R-2 buildings of Type IIIA construction.

The height limitation for buildings of Type IIIA construction in Groups R-1 and R-2 shall be increased to six stories and 22,860 mm (75 feet) where the first floor assembly above the basement has a fire-resistance rating of not less than 3 hours and the floor area is subdivided by 2-hour fire-resistance-rated fire walls into areas of not more than 279 m² (3,000 square feet).

6.13.6 Group R-1 and R-2 buildings of Type IIA construction.

The height limitation for buildings of Type IIA construction in Groups R-1 and R-2 shall be increased to nine stories and 30,480 mm (100 feet) where the building is separated by not less than 15,240 mm (50 feet) from any other building on the plot and from plot lines, the exits are segregated in an area enclosed by a 2-hour fire-resistance-rated fire wall and the first floor assembly has a fire-resistance rating of not less than $1\frac{1}{2}$ hours.

6.13.7 Open parking garage beneath Groups A, I, B, M and R.

Open parking garages constructed under Groups A, I, B, M and R shall not exceed the height and area limitations permitted under Clause 4.6.5. The height and area of the portion of the building above the open parking garage shall not exceed the limitations in Clause 6.3 for the upper occupancy. The height, in both feet and stories, of the portion of the building above the open parking garage shall be measured from grade plane and shall include both the open parking garage and the portion of the building above the parking garage.
6.13.7.1 Fire separation.

Fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11 between the parking occupancy and the upper occupancy shall correspond to the required fire-resistance rating prescribed in Table 6.11.4 for the uses involved. The type of construction shall apply to each occupancy individually, except that structural members, including main bracing within the open parking structure, which is necessary to support the upper occupancy, shall be protected with the more restrictive fire-resistance-rated assemblies of the groups involved as shown in Table 7.1. Means of escape for the upper occupancy shall conform to Part 11 and shall be separated from the parking occupancy by fire barriers having not less than a 2-hour fire-resistance rating as required by Clause 8.7 with self-closing doors complying with Clause 8.16 or horizontal assemblies having not less than a 2-hour fire-resistance rating as required by Clause 8.11, with self-closing doors complying with Clause 8.16. Means of escape from the open parking garage shall comply with Clause 4.6.5.

6.13.8 Group B or M buildings with Group S-2 open parking garage above.

Group B or M occupancies located below a Group S-2 open parking garage of a lesser type of construction shall be considered as a separate and distinct building from the Group S-2 open parking garage for the purpose of determining the type of construction where all of the following conditions are met:

1. The buildings are separated with a horizontal assembly having a fire-resistance rating of not less than 2 hours.

2. The occupancies in the building below the horizontal assembly are limited to Groups B and M.

3. The occupancy above the horizontal assembly is limited to a Group S-2 open parking garage.

4. The building below the horizontal assembly is of Type IA construction.

Exception: The building below the horizontal assembly shall be permitted to be of Type IB or II construction, but not less than the type of construction required for the Group S-2 open parking garage above, where the building below is not greater than one storey in height above grade plane.

5. The height and area of the building below the horizontal assembly does not exceed the limits set forth in Clause 6.3.

6. The height and area of the Group S-2 open parking garage does not exceed the limits set forth in Clause 4.6.5. The height, in both feet and stories, of the Group S-2 open parking garage shall be measured from grade plane and shall include the building below the horizontal assembly.

7. Exits serving the Group S-2 open parking garage discharge directly to a street or public way and are separated from the building below the horizontal assembly by 2-hour fire barriers constructed in accordance with Clause 8.7 or 2-hour horizontal assemblies constructed in accordance with Clause 8.11, or both.

6.13.9 Multiple buildings above a horizontal assembly.

Where two or more buildings are provided above the horizontal assembly separating a Group S-2 parking garage or building below from the buildings above in accordance with the special provisions in Clause 6.13.2, 6.13.3 or 6.13.8, the buildings above the horizontal assembly shall be regarded as separate and distinct buildings from each other and shall comply with all other provisions of this Code as applicable to each separate and distinct building.

6.14 ROOM AND SPACE DIMENSIONS

6.14.1 General

This clause applies only to dwelling units that are intended for use on a continuing basis as the principal residence of the occupant.

6.14.1.2 Method of measurement

Unless otherwise indicated herein, the areas, dimensions and heights of rooms or spaces
shall be measured between finished wall surfaces and between finished floor and ceiling surfaces.

6.14.1.3 Combined Space
Minimum dimensions listed for rooms or spaces in combination with other rooms or spaces refer to the minimum dimension of the combined space.

6.14.1.4. Floor areas
Minimum (usable) floor areas specified in this clause do not include closets or built-in bedroom cabinets unless otherwise indicated.

6.14.1.5 Combination rooms
Two or more areas are considered as a combination room if the dividing wall occupies less than 60 percent of the separating plane.

6.14.1.6 Areas and dimensions of rooms and spaces may be less than required in this clause provided it can be shown to the satisfaction of the authority having jurisdiction that the rooms and spaces are adequate for their intended use, such as by the provision of built-in furniture to compensate for reduced sizes.

6.14.2 Ceiling heights

6.14.2.1 Room heights
Heights of rooms or spaces in residential occupancies shall conform to Table 16.4.2.A

<table>
<thead>
<tr>
<th>Room or space</th>
<th>Minimum heights</th>
</tr>
</thead>
<tbody>
<tr>
<td>Living room or space, Dining room or space, Kitchen or kitchen space</td>
<td>2.3m over at least 75 percent of the required floor area with a clear height of at least 2.0m at any point over the required area.</td>
</tr>
<tr>
<td>Bedroom or bedroom space</td>
<td>2.3m over at least 50 percent of the required floor area</td>
</tr>
</tbody>
</table>

6.14.2.2 The clear height above and below a mezzanine floor assembly in all occupancies shall not be less than 2.0m unless otherwise permitted by the authority having jurisdiction.

6.14.2.3 The clear height in a storage garage shall not be less than 2.0m.

6.14.3 Living rooms or Spaces within dwelling units

6.14.3.1 Living room area
Living areas within dwelling units, either as separate rooms or in combination with other spaces, shall have at least 13.47m² of floor area and shall have no dimension less than 3m within the required areas. Where the area of a living space is combined with a kitchen and dining area, the living area alone in a bachelor dwelling unit shall be at least 11.15m².

Table 16.4.2.A – Ceiling heights
(Forming part of Article 7.4.2.1)
6.14.4 Dining rooms or spaces within dwelling units

6.14.4.1 A dining space in combination with other space shall have a minimum floor area of 3.25m². Dining rooms not combined with other space shall have a minimum area of 6.50m².

6.14.4.2 Except as permitted in Article 6.14.4.3, a dining room or space combined with other space shall have no dimension less than 2.3m within the required area measured between wall faces or a wall face and a built-in cabinet or appliance.

6.14.4.3 When a required dining area is provided in a kitchen or serves a bachelor dwelling unit, the minimum dimension of such space may be reduced to 1.7m.

6.14.5 Kitchen within dwelling units

6.14.5.1 Kitchen area
Kitchen areas within dwelling units either separate or in combination with other space shall have at least 7.43m² of floor area including the area occupied by the base cabinets, except that in bachelor dwelling units the minimum floor area shall be 3.72m².

6.14.5.2 At least 910mm clearance shall be provided in front of base cabinet, work surfaces, counter tops and appliances.

6.14.6 Bedroom or space in dwelling units

6.14.6.1 Main bedroom area
Except as provided in this Code at least one bedroom in every dwelling unit shall have at least 11.15m² of floor area where built-in cabinets are not provided and 10.10m² of floor area where built-in cabinets are provided. The minimum dimension within their required area shall be 2.7m.

6.14.6.2 Other bedroom areas
Except as provided in this Code additional bedrooms shall have at least 8.36m² of floor area where built-in cabinets are not provided and 7.57m² of floor area where built-in cabinets are provided. The minimum dimension within the required area shall be 2.44m.

6.14.6.3 Combination bedroom areas
Bedroom spaces in combination with other spaces shall have at least 5.05m² of floor area and have no dimension less than 1.98m within the required area.

6.14.7 Bathrooms and water-closet rooms

6.14.7.1 Bathroom areas
In every dwelling unit an enclosed space of a minimum of 3m² shall be provided to accommodate a bathtub or shower bath, water closet and lavatory basin.

6.14.7.2 At least 550mm clearance shall be provided in front of the tub or shower stall to an opposite wall face or 450mm in front to another fixture over at least 600mm length of the bathtub or shower.

6.14.7.3 The centre line of the water closet shall be at least 400mm away from an adjacent side wall and from a vanity. At least 450mm clearance shall be provided in front of the water closet to the opposite wall or another fixture.

6.14.7.4 The centre line of a lavatory basin shall be at least 400mm from an adjacent side wall. At least 550mm clearance shall be provided in front of the lavatory basin to an opposite wall or 450mm clearance in front to another fixture.

6.14.8 Hallways

6.14.8.1 Width of hallways
The width of a hallway within a dwelling unit shall be at least 1200mm.
PART 7: TYPES OF CONSTRUCTION

User note:
About this part: Part 7 establishes four types of construction in which each building must be categorized. This part looks at the materials used in the building (combustible or noncombustible) and the extent to which building elements such as building frame, roof, wall and floor can resist fire. Depending on the type of construction, the specific building element and its proximity to a plot line, fire resistance of 1 to 3 hours is specified.

7.1 GENERAL

7.1.1 Scope.

The provisions of this part shall control the classification of buildings as to type of construction.

The design of any building and types of materials used in its construction are important factors in making the building resistant to a complete burn-out and in preventing the spread of fire, smoke or fumes, which may otherwise contribute to the loss of lives and property. The fire resistance of a building or its structural and non-structural elements is expressed in hours against a specified fire load which is expressed in kcal/m² and against a certain intensity of fire. For the purposes of this Code, the types of construction according to fire resistance shall be classified in four (4) categories:

a) Type 1
b) Type 2
c) Type 3
d) Type 4

The fire resistance ratings for various types of construction for structural and non-structural members are given in Table 7.1A.
Table 7.1A - Fire resistance ratings of structural and non-structural elements (in hours)

For SI: 1 foot = 304.8 mm.
  a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
  b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
  c. In all occupancies, heavy timber complying with Clause 24.4.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
  d. Not less than the fire-resistance rating required by other clauses of this Code.
  e. Not less than the fire-resistance rating based on fire separation distance (see Table 7.2).
  f. Not less than the fire-resistance rating as referenced in Clause 8.4.10.

For SI: 1 foot = 304.8 mm.
a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 7.1.
b. See Clause 8.6.1.1 for party walls.
c. Open parking garages complying with Clause 4.6 shall not be required to have a fire-resistance rating.
d. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the storey in which the wall is located.
e. For special requirements for Group H occupancies, see Clause 4.15.6.
f. For special requirements for Group S aircraft hangars, see Clause 4.12.3.1.
g. Where Table 8.5.8 permits nonbearing exterior walls with unlimited area of unprotected openings, the required fire-resistance rating for the exterior wall is 0 hours.
h. For a building containing only a Group U occupancy private garage or carport, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.
i. For a Group R-3 building of Type I-B or Type IV-B construction, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.

7.2.1 General.

Buildings and structures erected or to be erected, altered or extended in height or area shall be classified in one of the five construction types defined in Clauses 7.2.2 through 7.2.5. The building elements shall have a fire-resistance rating not less than that specified in Table 7.1 and exterior walls shall have a fire-resistance rating not less than that specified in Table 7.2. Where required to have a fire-resistance rating by Table 7.1, building elements shall comply with the applicable provisions of Clause 7.3.2.

The protection of openings, ducts and air transfer openings in building elements shall not be required unless required by other provisions of this Code.

7.2.1.1 Minimum requirements.

A building or portion thereof shall not be required to conform to the details of a type of construction higher than that type which meets the minimum requirements based on occupancy even though certain features of such a building actually conform to a higher type of construction.

7.2.2 Types I.

Types I construction are those types of construction in which the building elements listed in Table 7.1 are of noncombustible materials, except as permitted in Clause 7.3 and elsewhere in this Code.

7.2.3 Type II.

Type II construction is that type of construction in which the exterior walls are of noncombustible materials and the interior
building elements are of any material permitted by this Code. Fire-retardant-treated wood framing and sheathing complying with Clause 24.3.2 shall be permitted within exterior wall assemblies of a 2-hour rating or less.

7.2.4 Type III.

Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated wood, heavy timber (HT) or structural composite timber (SCL) without concealed spaces. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, structural composite timber (SCL), and cross-laminated timber and details of Type III construction shall comply with the provisions of this clause and Clause 24.4.11. Exterior walls complying with Clause 7.2.4.1 or 7.2.4.2 shall be permitted. Interior walls and partitions not less than 1-hour fire-resistance rating or heavy timber complying with Clause 24.4.11.2.2 shall be permitted.

7.2.4.1 Fire-retardant-treated wood in exterior walls.

Fire-retardant-treated wood framing and sheathing complying with Clause 24.3.2 shall be permitted within exterior wall assemblies not less than 152 mm (6 inches) in thickness with a 2-hour rating or less.

7.2.4.2 Cross-laminated timber in exterior walls.

Cross-laminated timber complying with Clause 24.3.1.4 shall be permitted within exterior wall assemblies not less than 152 mm (6 inches) in thickness with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:

1. Fire-retardant-treated wood sheathing complying with Clause 24.3.2 and not less than 12 mm (15 / 32 inch) thick;
2. Gypsum board not less than 12.7 mm (1 / 2 inch) thick; or
3. A noncombustible material.

7.2.4.3 Exterior structural members.

Where a horizontal separation of 6096 mm (20 feet) or more is provided, wood columns and arches conforming to heavy timber sizes complying with Clause 24.4.11 shall be permitted to be used externally.

7.3 COMBUSTIBLE MATERIAL IN TYPES I AND II CONSTRUCTION

7.3.1 Allowable materials.

Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Clauses 7.3.1.1 through 7.3.1.3:

1. Fire-retardant-treated wood shall be permitted in:
   1.1. Nonbearing partitions where the required fire-resistance rating is 2 hours or less.
   1.2. Nonbearing exterior walls where fire-resistance-rated construction is not required.
   1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two stories above grade plane, fire-retardant-treated wood is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 6096 mm (20 feet).

1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three stories or less above grade plane.

2. Thermal and acoustical insulation, other than foam plastics, having a flame spread index of not more than 25.

Exceptions:
1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a flame spread index of not more than 100.

2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a flame spread index of not more than 200.

3. Foam plastics in accordance with Part 27.

4. Roof coverings that have an A, B or C classification.

5. Interior floor finish and floor covering materials installed in accordance with Clause 8.4.

6. Millwork such as doors, door frames, window sashes and frames.

7. Interior wall and ceiling finishes installed in accordance with Clause 9.3.

8. Trim installed in accordance with Clause 9.6.

9. Where not installed greater than 4572 mm (15 feet) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.

10. Finish flooring installed in accordance with Clause 9.5.

11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a corridor serving an occupant load of 30 or more shall be permitted to be constructed of fire-retardant-treated wood, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 1829 mm (6 feet) in height.

12. Stages and platforms constructed in accordance with Clause 4.10.2 and 4.10.3 respectively.

13. Combustible exterior wall coverings, balconies and similar projections and bay or oriel windows in accordance with part 15 and Clause 8.5.2.3.1.

14. Blocking such as for handrails, millwork, cabinets and window and door frames.

15. Light-transmitting plastics as permitted by Part 27.

16. Mastics and caulking materials applied to provide flexible seals between components of exterior wall construction.

17. Exterior plastic veneer installed in accordance with Clause 27.5.2.

18. Nailing or furring strips as permitted by Clause 9.3.15.

19. Heavy timber as permitted by Note c to Table 7.1 and Clauses 7.2.4.3 and 7.5.2.3.1.

20. Aggregates, component materials and admixtures as permitted by Clause 8.3.2.2.

21. Spray-in fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of fire resistance tests in accordance with Clause 8.3.2 and installed in accordance with Clauses 19.5.14 and 19.5.15), respectively.

22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Clause 8.14.

23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Clause 8.15.

of Types I construction in accordance with Clause 8.18.5.

25. Materials exposed within plenums complying with Clause 7.2 of this Code.

26. Wall construction of freezers and coolers of less than 92.9 m² (1,000 square feet), in size, lined on both sides with noncombustible materials and the building is protected throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

7.3.1.1 Ducts.

The use of nonmetallic ducts shall be permitted where installed in accordance with the limitations of this Code.

7.3.1.2 Piping.

The use of combustible piping materials shall be permitted where installed in accordance with the limitations of this Code.

7.3.1.3 Electrical.

The use of electrical wiring methods with combustible insulation, tubing, raceways and related components shall be permitted where installed in accordance with the limitations of this Code.
PART 8: FIRE AND SMOKE PROTECTION FEATURES

User note:
About this part: Part 8 provides detailed requirements for fire-resistance-rated construction, including structural members, walls, partitions and horizontal assemblies. Other portions of the Code describe where certain fire-resistance-rated elements are required. This Part specifies how these elements are constructed, how openings in walls and partitions are protected and how penetrations of such elements are protected.

8.1 GENERAL

8.1.1 Scope.
The provisions of this part shall govern the materials, systems and assemblies used for structural fire resistance and fire-resistance-rated construction separation of adjacent spaces to safeguard against the spread of fire and smoke within a building and the spread of fire to or from buildings.

8.2 MULTIPLE USE FIRE ASSEMBLIES

8.2.1 Multiple use fire assemblies.
Fire assemblies that serve multiple purposes in a building shall comply with all of the requirements that are applicable for each of the individual fire assemblies.

8.3 FIRE-RESISTANCE RATINGS AND FIRE TESTS

8.3.1 Scope.
Materials prescribed herein for fire resistance shall conform to the requirements of this part.

8.3.2 Fire-resistance ratings.
The fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or in accordance with Clause 8.3.3. The fire-resistance rating of penetrations and fire-resistant joint systems shall be determined in accordance Clauses 8.14 and 8.15, respectively.

8.3.2.1 Nonsymmetrical wall construction.
Interior walls and partitions of nonsymmetrical construction shall be tested with both faces exposed to the furnace, and the assigned fire-resistance rating shall be the shortest duration obtained from the two tests conducted in compliance with ASTM E119. Where evidence is furnished to show that the wall was tested with the least fire-resistant side exposed to the furnace, subject to acceptance of the building official, the wall need not be subjected to tests from the opposite side (see Clause 8.5.5 for exterior walls).

8.3.2.2 Combustible components.
Combustible aggregates are permitted in gypsum and Portland cement concrete mixtures for fire-resistance-rated construction. Any component material or admixture is permitted in assemblies if the resulting tested assembly meets the fire-resistance test requirements of this Code.

8.3.2.3 Restrained classification.
Fire-resistance-rated assemblies tested under ASTM E119 shall not be considered to be restrained unless evidence satisfactory to the building official is furnished by the registered design professional showing that the construction qualifies for a restrained classification in accordance with ASTM E119. Restrained construction shall be identified on the construction documents.

8.3.2.4 Supplemental features.
Where materials, systems or devices that have not been tested as part of a fire-resistance-rated assembly are incorporated into the building element, component or assembly, sufficient data shall be made available to the building official to show that the required fire-resistance rating is not reduced.

8.3.2.5 Exterior bearing walls.
In determining the fire-resistance rating of exterior bearing walls, compliance with the ASTM E119 criteria for unexposed surface temperature rise and ignition of cotton waste due to passage of flame or gases is required.
only for a period of time corresponding to the required fire-resistance rating of an exterior nonbearing wall with the same fire separation distance, and in a building of the same group. Where the fire-resistance rating determined in accordance with this exception exceeds the fire-resistance rating determined in accordance with ASTM E119, the fire exposure time period, water pressure and application duration criteria for the hose stream test of ASTM E119 shall be based on the fire-resistance rating determined in accordance with this clause.

8.3.3 Methods for determining fire resistance.

The application of any of the methods listed in this clause shall be based on the fire exposure and acceptance criteria specified in ASTM E119. The required fire resistance of a building element, component or assembly shall be permitted to be established by any of the following methods or procedures:

1. Fire-resistance designs documented in approved sources.

2. Prescriptive designs of fire-resistance-rated building elements, components or assemblies as prescribed in Clause 8.21.

3. Calculations in accordance with Clause 8.22.

4. Engineering analysis based on a comparison of building element, component or assemblies designs having fire-resistance ratings as determined by the test procedures set forth in ASTM E119.

5. Alternative protection methods as allowed by Clause 1.4.11.

6. Fire-resistance designs certified by an approved agency.

8.3.4 Automatic sprinklers.

Under the prescriptive fire-resistance requirements of this Code, the fire-resistance rating of a building element, component or assembly shall be established without the use of automatic sprinklers or any other fire suppression system being incorporated as part of the assembly tested in accordance with the fire exposure, procedures and acceptance criteria specified in ASTM E119. However, this clause shall not prohibit or limit the duties and powers of the building official allowed by Clauses 1.4.10 and 1.4.11.

8.3.5 Noncombustibility tests.

The tests indicated in Clauses 8.3.5.1 and 8.3.5.2 shall serve as criteria for acceptance of building materials as set forth in clause 7.2.2, 7.2.3 and 7.2.4 in Types I and II construction. The term “non-combustible” does not apply to the flame spread characteristics of interior finish or trim materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or flame spread beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

8.3.6 Fire-resistance-rated glazing.

Fire-resistance-rated glazing, when tested in accordance with ASTM E119 and complying with the requirements of Clause 9.7, shall be permitted. Fire-resistance-rated glazing shall bear a label marked in accordance with Table 8.16.1(1) issued by an agency and shall be permanently identified on the glazing.

8.3.7 Marking and identification.

Where there is an accessible concealed floor, floor-ceiling or attic space, fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions or any other wall required to have protected openings or penetrations shall be effectively and permanently identified with signs or stenciling in the concealed space. Such identification shall:

1. Be located within 4572 mm (15 feet) of the end of each wall and at intervals not exceeding 9144 mm (30 feet) measured horizontally along the wall or partition.

2. Include lettering not less than 76 mm (3 inches) in height with a minimum 9.5 mm (3/8-inch) stroke in a contrasting colour incorporating the suggested wording, “FIRE AND/OR SMOKE BARRIER—PROTECT ALL OPENINGS,” or other wording.
8.4 FIRE-RESISTANCE RATING OF STRUCTURAL MEMBERS

8.4.1 Requirements.

The fire-resistance ratings of structural members and assemblies shall comply with this clause and the requirements for the type of construction as specified in Table 7.1. The fire-resistance ratings shall be not less than the ratings required for the fire-resistance-rated assemblies supported by the structural members.

Exception: Fire barriers, fire partitions, smoke barriers and horizontal assemblies as provided in Clauses 8.7.5, 8.8.4, 8.9.4 and 8.11.2, respectively.

8.4.2 Column protection.

Where columns are required to have protection to achieve a fire-resistance rating, the entire column shall be provided individual encasement protection by protecting it on all sides for the full column height, including connections to other structural members, with materials having the required fire-resistance rating. Where the column extends through a ceiling, the encasement protection shall be continuous from the top of the foundation or floor/ceiling assembly below through the ceiling space to the top of the column.

Exception: Columns that meet the limitations of Clause 8.4.4.1.

8.4.3 Protection of the primary structural frame other than columns.

Members of the primary structural frame other than columns that are required to have protection to achieve a fire-resistance rating and support more than two floors or one floor and roof, or support a load-bearing wall or a nonload-bearing wall more than two stories high, shall be provided individual encasement protection by protecting them on all sides for the full length, including connections to other structural members, with materials having the required fire-resistance rating.

Exception: Individual encasement protection on all sides shall be permitted on all exposed sides provided that the extent of protection is in accordance with the required fire-resistance rating, as determined in Clause 8.3.

8.4.4 Protection of secondary members.

Secondary members that are required to have protection to achieve a fire-resistance rating shall be protected by individual encasement protection.

8.4.4.1 Light-frame construction.

Studs, columns and boundary elements that are integral elements in walls of light-frame construction and are located entirely between the top and bottom plates or tracks shall be permitted to have required fire-resistance ratings provided by the membrane protection provided for the wall.

8.4.4.2 Horizontal assemblies.

Horizontal assemblies are permitted to be protected with a membrane or ceiling where the membrane or ceiling provides the required fire-resistance rating and is installed in accordance with Clause 8.11.

8.4.5 Truss protection.

The required thickness and construction of fire-resistance-rated assemblies enclosing trusses shall be based on the results of full-scale tests or combinations of tests on truss components or on approved calculations based on such tests that satisfactorily demonstrate that the assembly has the required fire resistance.

8.4.6 Attachments to structural members.

The edges of lugs, brackets, rivets and bolt heads attached to structural members shall be permitted to extend to within 25 mm (1 inch) of the surface of the fire protection.

8.4.7 Reinforcing.

Thickness of protection for concrete or masonry reinforcement shall be measured to the outside of the reinforcement except that stirrups and spiral reinforcement ties are permitted to project not more than 12.7 mm (0.5-inch) into the protection.
8.4.8 Embedments and enclosures.

Pipes, wires, conduits, ducts or other service facilities shall not be embedded in the required fire protective covering of a structural member that is required to be individually encased.

8.4.9 Impact protection.

Where the fire protective covering of a structural member is subject to impact damage from moving vehicles, the handling of merchandise or other activity, the fire protective covering shall be protected by corner guards or by a substantial jacket of metal or other noncombustible material to a height adequate to provide full protection, but not less than 1524 mm (5 feet) from the finished floor.

Exception: Corner protection is not required on concrete columns in parking garages.

8.4.10 Exterior structural members.

Load-bearing structural members located within the exterior walls or on the outside of a building or structure shall be provided with the highest fire-resistance rating as determined in accordance with the following:

1. As required by Table 7.1 for the type of building element based on the type of construction of the building.
2. As required by Table 7.1 for exterior bearing walls based on the type of construction.
3. As required by Table 7.2 for exterior walls based on the fire separation distance.

8.4.11 Bottom flange protection.

Fire protection is not required at the bottom flange of lintels, shelf angles and plates, spanning not more than 1931 mm (6 feet 4 inches) whether part of the primary structural frame or not, and from the bottom flange of lintels, shelf angles and plates not part of the structural frame, regardless of span.

8.4.12 Seismic isolation systems.

Fire-resistance ratings for the isolation system shall meet the fire-resistance rating required for the columns, walls or other structural elements in which the isolation system is installed in accordance with Table 7.1. Isolation systems required to have a fire-resistance rating shall be protected with approved materials or construction assemblies designed to provide the same degree of fire resistance as the structural element in which the system is installed when tested in accordance with ASTM E119 (see Clause 8.3.2).

Such isolation system protection applied to isolator units shall be capable of retarding the transfer of heat to the isolator unit in such a manner that the required gravity load-carrying capacity of the isolator unit will not be impaired after exposure to the standard time-temperature curve fire test prescribed in ASTM E119 for a duration not less than that required for the fire-resistance rating of the structure element in which the system is installed.

Such isolation system protection applied to isolator units shall be suitably designed and securely installed so as not to dislodge, loosen, sustain damage or otherwise impair its ability to accommodate the seismic movements for which the isolator unit is designed and to maintain its integrity for the purpose of providing the required fire-resistance protection.

8.4.13 Sprayed fire-resistant materials (SFRM).

Sprayed fire-resistant materials (SFRM) shall comply with Clauses 8.4.13.1 through 8.4.13.5.

8.4.13.1 Fire-resistance rating.

The application of SFRM shall be consistent with the fire-resistance rating and the listing, including, but not limited to, minimum thickness and dry density of the applied SFRM, method of application, substrate surface conditions and the use of bonding adhesives, sealants, reinforcing or other materials.

8.4.13.2 Manufacturer’s installation instructions.

The application of SFRM shall be in accordance with the manufacturer’s installation instructions. The instructions shall include, but are not limited to, substrate temperatures and surface conditions and SFRM handling, storage, mixing, conveyance, method of application, curing and ventilation.
8.4.13.3 Substrate condition.
The SFRM shall be applied to a substrate in compliance with Clauses 8.4.13.3.1 and 8.4.13.3.2.

8.4.13.3.1 Surface conditions.
Substrates to receive SFRM shall be free of dirt, oil, grease, release agents, loose scale and any other condition that prevents adhesion. The substrates shall be free of primers, paints and encapsulants other than those fire tested and listed by a nationally recognized testing agency. Primed, painted or encapsulated steel shall be allowed, provided that testing has demonstrated that required adhesion is maintained.

8.4.13.3.2 Primers, paints and encapsulants.
Where the SFRM is to be applied over primers, paints or encapsulants other than those specified in the listing, the material shall be field tested in accordance with ASTM E736. Where testing of the SFRM with primers, paints or encapsulants demonstrates that required adhesion is maintained, SFRM shall be permitted to be applied to primed, painted or encapsulated wide flange steel shapes in accordance with the following conditions:

1. The beam flange width does not exceed 305 mm (12 inches); or
2. The column flange width does not exceed 400 mm (16 inches); or
3. The beam or column web depth does not exceed 400 mm (16 inches).
4. The average and minimum bond strength values shall be determined based on not fewer than five bond tests conducted in accordance with ASTM E736. Bond tests conducted in accordance with ASTM E736 shall indicate an average bond strength of not less than 80 percent and an individual bond strength of not less than 50 percent, when compared to the bond strength of the SFRM as applied to clean uncoated 3.2 mm (1/8-inch-thick) steel plate.

8.4.13.4 Temperature.
A minimum ambient and substrate temperature of 40°F (4.44°C) shall be maintained during and for not fewer than 24 hours after the application of the SFRM, unless the manufacturer’s instructions allow otherwise.

8.4.13.5 Finished condition.
The finished condition of SFRM applied to structural members or assemblies shall not, upon complete drying or curing, exhibit cracks, voids, spills, delamination or any exposure of the substrate. Surface irregularities of SFRM shall be deemed acceptable.

8.5 EXTERIOR WALLS

8.5.1 General.
Exterior walls shall comply with this clause.

8.5.2 Projections.
Cornices, eave overhangs, exterior balconies and similar projections extending beyond the exterior wall shall conform to the requirements of this clause and Par 15. Exterior Escape balconies and exterior exit stairways and ramps shall comply with Clauses 11.21 and 11.27, respectively. Projections shall not extend any closer to the line used to determine the fire separation distance than shown in Table 8.5.2.

**Exception:** Buildings on the same plot and considered as portions of one building in accordance with Clause 8.5.3 are not required to comply with this clause for projections between the buildings.

<table>
<thead>
<tr>
<th>FIRE SEPARATION DISTANCE-FSD (feet)</th>

<tr>
<td>3 to less than 5</td>
<td>24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof</td>
</tr>
<tr>
<td>5 or greater</td>
<td>40 inches</td>
</tr>
</tbody>
</table>

**NOTE:** For SI: 1 foot = 304.8 mm; 1 inch = 25.4 mm.

8.5.2.1 Types I construction.
Projections from walls of Type I construction shall be of noncombustible materials or combustible materials as allowed by Clauses 8.5.2.3.1 and 8.5.2.4.
8.5.2.2 Type II, III or IV construction.

Projections from walls of Type II, III or IV construction shall be of any approved material.

8.5.2.3 Combustible projections.

Combustible projections extending to within 1524 mm (5 feet) of the line used to determine the fire separation distance shall be of not less than 1-hour fire-resistance-rated construction, heavy timber construction, complying with Clause 24.4.11, fire-retardant-treated wood or as permitted by Clause 8.5.2.3.1.

Exception: Type IVB construction shall be allowed for combustible projections in Group R-3 and U occupancies with a fire separation distance greater than or equal to 1524 mm (5 feet).

8.5.2.3.1 Balconies and similar projections.

Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 7.1 for floor construction or shall be of heavy timber construction in accordance with Clause 24.4.11. The aggregate length of the projections shall not exceed 50 percent of the building’s perimeter on each floor.

Exceptions:

1. On buildings of Types I construction, three stories or less above grade plane, fire-retardant-treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.

2. Untreated wood and plastic composites that comply with ASTM D7032 and Clause 27.12 are permitted for pickets, rails and similar guard components that are limited to 42 inches (1067 mm) in height.

3. Balconies and similar projections on buildings of Types II, III and IV construction shall be permitted to be of Type IV construction and shall not be required to have a fire-resistance rating where sprinkler protection is extended to these areas.

4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.

8.5.2.4 Bay and oriel windows.

Bay and oriel windows constructed of combustible materials shall conform to the type of construction required for the building to which they are attached.

Exception: Fire-retardant-treated wood shall be permitted on buildings three stories or less above grade plane of Type I, II, III or IV construction.

8.5.3 Buildings on the same plot.

For the purposes of determining the required wall and opening protection, projections and roof-covering requirements, buildings on the same plot shall be assumed to have an imaginary line between them.

Where a new building is to be erected on the same plot as an existing building, the location of the assumed imaginary line with relation to the existing building shall be such that the exterior wall and opening protection of the existing building meet the criteria as set forth in Clauses 8.5.5 and 8.5.8.

Exceptions:

1. Two or more buildings on the same plot shall be either regulated as separate buildings or shall be considered as portions of one building if the aggregate area of such buildings is within the limits specified in Part 6 for a single building. Where the buildings contain different occupancy groups or are of different types of construction, the area shall be that allowed for the most restrictive occupancy or construction.

2. Where an S-2 parking garage of Construction Type I or IIA is erected on the same plot as a Group R-2 building, and there is no fire separation distance between these buildings, then the adjoining exterior walls between the buildings are permitted to have occupant use openings in accordance with Clause 8.6.8. However, opening protective in such openings shall only be required in the exterior wall of the S-2 parking garage, not in the exterior wall
openings in the R-2 building, and these opening protective in the exterior wall of the S-2 parking garage shall be not less than 11/2-hour fire protection rating.

8.5.4 Materials.

Exterior walls shall be of materials permitted by the building type of construction.

8.5.5 Fire-resistance ratings.

Exterior walls shall be fire-resistance rated in accordance with Tables 7.1 and 7.2 and this clause. The required fire-resistance rating of exterior walls with a fire separation distance of greater than 3048 mm (10 feet) shall be rated for exposure to fire from the inside. The required fire-resistance rating of exterior walls with a fire separation distance of less than or equal to 3048 mm (10 feet) shall be rated for exposure to fire from both sides.

8.5.6 Structural stability.

Exterior walls shall extend to the height required by Clause 8.5.11. Interior structural elements that brace the exterior wall but that are not located within the plane of the exterior wall shall have the minimum fire-resistance rating required in Table 601 for that structural element. Structural elements that brace the exterior wall but are located outside of the exterior wall or within the plane of the exterior wall shall have the minimum fire-resistance rating required in this code for the exterior wall.

8.5.7 Unexposed surface temperature.

Where protected openings are not limited by Clause 8.5.8, the limitation on the rise of temperature on the unexposed surface of exterior walls as required by ASTM E119 shall not apply. Where protected openings are limited by Clause 8.5.8, the limitation on the rise of temperature on the unexposed surface of exterior walls as required by ASTM E119 shall not apply provided that a correction is made for radiation from the unexposed exterior wall surface in accordance with the following formula:

\[ Ae = A + (A_f \times Feo) \]

(Equation 8-1)

Where:

\[ Ae \] = Equivalent area of protected openings.

\[ A \] = Actual area of protected openings

\[ A_f \] = Area of exterior wall surface in the storey under consideration exclusive of openings, on which the temperature limitations of ASTM E119 for walls are exceeded.

\[ Feo \] = An “equivalent opening factor” derived from Figure 8.5.7 based on the average temperature of the unexposed wall surface and the fire-resistance rating of the wall.
FIGURE 8.5.7 EQUIVALENT OPENING FACTOR

8.5.8 Openings.
Openings in exterior walls shall comply with Clauses 8.5.8.1 through 8.5.8.6.

TABLE 8.5.8 MAXIMUM AREA OF EXTERIOR WALL OPENINGS BASED ON FIRE SEPARATION DISTANCE AND DEGREE OF OPENING PROTECTION

</tbody>
</table>

Note: For SI: °C = [(°F) - 32] / 1.8.
### 8.5.8.1 Allowable area of openings.

The maximum area of unprotected and protected openings permitted in an exterior wall in any storey of a building shall not exceed the percentages specified in Table 8.5.8 based on the fire separation distance of each individual storey.

#### Exceptions:

1. In other than Group H occupancies, unlimited unprotected openings are permitted in the first storey above grade plane where the wall faces one of the following:
   
   1.1. A street and has a fire separation distance of more than 4572 mm (15 feet).
   
   1.2. An unoccupied space. The unoccupied space shall be on the same plot or dedicated for public use, shall be not less than 30 feet (9144 mm) in width and shall have access from a street by a posted fire lane in accordance with the Ghana Fire Code.

### 8.5.8.2 Protected openings.

Where openings are required to be protected, opening protective shall comply with Clause 8.16.

**Exception:** Opening protective are not required where the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 and the exterior openings are protected by a water curtain using automatic sprinklers approved for that use.

### 8.5.8.3 Unprotected openings.

Where unprotected openings are permitted, windows and doors shall be constructed of any approved materials. Glazing shall conform to the requirements of Parts 25 and 27.
8.5.8.4 Mixed openings.

Where both unprotected and protected openings are located in the exterior wall in any storey of a building, the total area of openings shall be determined in accordance with the following:

\[(A_p/a_p) + (A_u/a_u) \leq 1\]

Where:
- \(A_p\) = Actual area of protected openings, or the equipment area of protected openings, \(A_e\) (see Clause 8.5.7).
- \(a_p\) = Allowable area of protected openings.
- \(A_u\) = Actual area of unprotected openings.
- \(a_u\) = Allowable area of unprotected openings.

8.5.8.5 Vertical separation of openings.

Openings in exterior walls in adjacent stories shall be separated vertically to protect against fire spread on the exterior of the buildings where the openings are within 1524 mm (5 feet) of each other horizontally and the opening in the lower storey is not a protected opening with a fire protection rating of not less than 3/4 hour. Such openings shall be separated vertically not less than 914 mm (3 feet) by spandrel girders, exterior walls or other similar assemblies that have a fire-resistance rating of not less than 1 hour, rated for exposure to fire from both sides, or by flame barriers that extend horizontally not less than 762 mm (30 inches) beyond the exterior wall. Flame barriers shall have a fire-resistance rating of not less than 1 hour. The unexposed surface temperature limitations specified in ASTM E119 shall not apply to the flame barriers unless otherwise required by the provisions of this Code.

Exceptions:

1. Opening protectives are not required where the roof assembly of the adjacent building or structure has a fire-resistance rating of not less than 1 hour for a minimum distance of 3048 mm (10 feet) from the exterior wall facing the imaginary line and the entire length and span of the supporting elements for the fire-resistance-rated roof assembly has a fire-resistance rating of not less than 1 hour.

2. Buildings on the same plot and considered as portions of one building in accordance with Clause 8.5.3 are not required to comply with Clause 8.5.6.

8.5.8.6 Vertical exposure.

For buildings on the same plot, opening protectives having a fire protection rating of not less than 3/4 hour shall be provided in every opening that is less than 4572 mm (15 feet) vertically above the roof of an adjacent building or structure based on assuming an imaginary line between them. The opening protectives are required where the fire separation distances from the imaginary line to each building or structure are less than 4572 mm (15 feet).

Exceptions:

1. Opening protectives are not required where the roof assembly of the adjacent building or structure has a fire-resistance rating of not less than 1 hour for a minimum distance of 3048 mm (10 feet) from the exterior wall facing the imaginary line and the entire length and span of the supporting elements for the fire-resistance-rated roof assembly has a fire-resistance rating of not less than 1 hour.

2. Buildings on the same plot and considered as portions of one building in accordance with Clause 8.5.3 are not required to comply with Clause 8.5.6.

8.5.9 Joints.

Joints made in or between exterior walls required by this clause to have a fire-resistance rating shall comply with Clause 8.15.

Exception: Joints in exterior walls that are permitted to have unprotected openings.

8.5.9.1 Voids.

The void created at the interclause of a floor/ceiling assembly and an exterior curtain wall assembly shall be protected in accordance with Clause 8.15.4.

8.5.10 Ducts and air transfer openings.

Penetrations by air ducts and air transfer openings in fire-resistance-rated exterior walls required to have protected openings shall comply with Clause 8.17.
**Exception:** Foundation vents installed in accordance with this Code are permitted.

### 8.5.11 Parapets.

Parapets shall be provided on exterior walls of buildings.

**Exceptions:** A parapet need not be provided on an exterior wall where any of the following conditions exist:

1. The wall is not required to be fire-resistance rated in accordance with this code because of fire separation distance.

2. The building has an area of not more than 1,000 square feet (93 m²) on any floor.

3. Walls that terminate at roofs of not less than 2-hour fire-resistance-rated construction or where the roof, including the deck or slab and supporting construction, is constructed entirely of noncombustible materials.

4. One-hour fire-resistance-rated exterior walls that terminate at the underside of the roof sheathing, deck or slab, provided that:

   4.1. Where the roof/ceiling framing elements are parallel to the walls, such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction for a width of 1220 mm (4 feet) for Groups R and U and 3048 mm (10 feet) for other occupancies, measured from the interior side of the wall.

   4.2. Where roof/ceiling framing elements are not parallel to the wall, the entire span of such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction.

   4.3. Openings in the roof shall not be located within 5 feet (1524 mm) of the 1-hour fire-resistance-rated exterior wall for Groups R and U and 3048 mm (10 feet) for other occupancies, measured from the interior side of the wall.

4.4. The entire building shall be provided with not less than a Class B roof covering.

5. In Groups R-2 and R-3 where the entire wall is provided with a Class C roof covering, the exterior wall shall be permitted to terminate at the underside of the roof sheathing or deck in Types II, III and IV construction, provided that one or both of the following criteria is met:

   5.1. The roof sheathing or deck is constructed of approved noncombustible materials or of fire-retardant-treated wood for a distance of 1220 mm (4 feet).

   5.2. The roof is protected with 16 mm (0.625-inch) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by not less than nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members for a minimum distance of 1220 mm (4 feet).

6. Where the wall is permitted to have not less than 25 percent of the exterior wall areas containing unprotected openings based on fire separation distance as determined in accordance with Clause 8.5.8.

#### 8.5.11.1 Parapet construction.

Parapets shall have the same fire-resistance rating as that required for the supporting wall, and on any side adjacent to a roof surface, shall have noncombustible faces for the uppermost 457 mm (18 inches), including counterflashing and coping materials. The height of the parapet shall be not less than 762 mm (30 inches) above the point where the roof surface and the wall intersect. Where the roof slopes toward a parapet at a slope greater than two units vertical in 12 units horizontal (16.7-percent slope), the parapet shall extend to the same height as any portion of the roof within a fire separation distance where protection of wall openings is required, but the height shall be not less than 762 mm (30 inches).

### 8.6 FIRE WALLS

#### 8.6.1 General.

Fire walls shall be constructed in accordance with Clauses 8.6.2 through 8.6.11. The extent and location of such fire walls shall provide a complete separation. Where a fire wall separates occupancies that are required to be separated by a fire barrier wall, the most restrictive requirements of each separation shall apply.
8.6.1.1 Party walls.

Any wall located on a plot line between adjacent buildings, which is used or adapted for joint service between the two buildings, shall be constructed as a fire wall in accordance with Clause 8.6. Party walls shall be constructed without openings and shall create separate buildings.

Exceptions:
1. Openings in a party wall separating an anchor building and a mall shall be in accordance with Clause 4.2.4.2.2.1.
2. Fire walls are not required on plot lines dividing a building for ownership purposes where the aggregate height and area of the portions of the building located on both sides of the plot line do not exceed the maximum height and area requirements of this Code. For the Code official's review and approval, he or she shall be provided with copies of dedicated access easements and contractual agreements that permit the owners of portions of the building located on either side of the plot line access to the other side for purposes of maintaining fire and life safety systems necessary for the operation of the building.

8.6.2 Structural stability.

Fire walls shall be designed and constructed to allow collapse of the structure on either side without collapse of the wall under fire conditions. Fire walls designed and constructed in accordance with the Ghana Fire Code shall be deemed to comply with this clause.

Exception: In Seismic Design Categories D through F, where double fire walls are used in accordance with the Ghana Fire Code, floor and roof sheathing not exceeding 3/4 inch (19.05 mm) thickness shall be permitted to be continuous through the wall assemblies of light frame construction.

8.6.3 Materials.

Fire walls shall be of any approved noncombustible materials.

8.6.4 Fire-resistance rating.

Fire walls shall have a fire-resistance rating of not less than that required by Table 8.6.4.

<table>
<thead>
<tr>
<th>GROUP</th>
<th>FIRE-RESISTANCE RATING (hours)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A, B, E, H-4, I, R-1, R-2, U</td>
<td>3 a</td>
</tr>
<tr>
<td>F-1, H-3, H-5, M, S-1</td>
<td>3</td>
</tr>
<tr>
<td>H-1, H-2</td>
<td>4 b</td>
</tr>
<tr>
<td>F-2, S-2, R-3, R-4</td>
<td>2</td>
</tr>
</tbody>
</table>

Note: a. In Type II or V construction, walls shall be permitted to have a 2-hour fire-resistance rating.

b. For Group H-1, H-2 or H-3 buildings, also see Clauses 4.15.7 and 4.15.8.

8.6.5 Horizontal continuity.

Fire walls shall be continuous from exterior wall to exterior wall and shall extend not less than 457 mm (18 inches) beyond the exterior surface of exterior walls.

Exceptions:
1. Fire walls shall be permitted to terminate at the interior surface of combustible exterior sheathing or siding provided that the exterior wall has a fire-resistance rating of not less than 1 hour for a horizontal distance of not less than 1220 mm (4 feet) on both sides of the fire wall. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.
2. Fire walls shall be permitted to terminate at the interior surface of noncombustible exterior sheathing, exterior siding or other noncombustible exterior finishes provided that the sheathing, siding or other exterior noncombustible finish extends a horizontal distance of not less than 1220 mm (4 feet) on both sides of the fire wall.
3. Fire walls shall be permitted to terminate at the interior surface of noncombustible exterior sheathing where the building on each side of the fire wall is protected by an automatic sprinkler system installed in
accordance with Clause 10.3.3.1.1 and 10.3.3.1.2.

8.6.5.1 Exterior walls.
Where the fire wall intersects exterior walls, the fire-resistance rating and opening protection of the exterior walls shall comply with one of the following:

1. The exterior walls on both sides of the fire wall shall have a 1-hour fire-resistance rating with 3/4-hour protection where opening protection is required by Clause 8.5.8. The fire-resistance rating of the exterior wall shall extend not less than 1220 mm (4 feet) on each side of the interclause of the fire wall to exterior wall. Exterior wall interclauses at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad) do not need exterior wall protection.

2. Buildings or spaces on both sides of the intersecting fire wall shall assume to have an imaginary plot line at the fire wall and extending beyond the exterior of the fire wall. The location of the assumed line in relation to the exterior walls and the fire wall shall be such that the exterior wall and opening protection meet the requirements set forth in Clauses 8.5.5 and 8.5.8. Such protection is not required for exterior walls terminating at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad).

8.6.5.2 Horizontal projecting elements.
Fire walls shall extend to the outer edge of horizontal projecting elements such as balconies, roof overhangs, canopies, marquees and similar projections that are within 1220 mm (4 feet) of the fire wall.

Exceptions:
1. Horizontal projecting elements without concealed spaces, provided that the exterior wall behind and below the projecting element has not less than 1-hour fire-resistance-rated construction for a distance not less than the depth of the projecting element on both sides of the fire wall. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.

2. Noncombustible horizontal projecting elements with concealed spaces, provided that a minimum 1-hour fire-resistance-rated wall extends through the concealed space. The projecting element shall be separated from the building by not less than 1-hour fire-resistance-rated construction for a distance on each side of the fire wall equal to the depth of the projecting element. The wall is not required to extend under the projecting element where the building exterior wall is not less than 1-hour fire-resistance rated for a distance on each side of the fire wall equal to the depth of the projecting element. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.

3. For combustible horizontal projecting elements with concealed spaces, the fire wall need only extend through the concealed space to the outer edges of the projecting elements. The exterior wall behind and below the projecting element shall be of not less than 1-hour fire-resistance-rated construction for a distance not less than the depth of the projecting elements on both sides of the fire wall. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.

8.6.6 Vertical continuity.
Fire walls shall extend from the foundation to a termination point not less than 30 inches (762 mm) above both adjacent roofs.

Exceptions:
1. Stepped buildings in accordance with Clause 8.6.6.1.

2. Two-hour fire-resistance-rated walls shall be permitted to terminate at the underside of the roof sheathing, deck or slab, provided that:
   2.1. The lower roof assembly within 1220 mm (4 feet) of the wall has not less than a 1-hour fire-resistance rating and the entire length and span of supporting elements for the rated roof...
assembly has a fire-resistance rating of not less than 1 hour.

2.2. Openings in the roof shall not be located within 1220 mm (4 feet) of the fire wall.

2.3. Each building shall be provided with not less than a Class B roof covering.

3. Walls shall be permitted to terminate at the underside of noncombustible roof sheathing, deck or slabs where both buildings are provided with not less than a Class B roof covering. Openings in the roof shall not be located within 1220 mm (4 feet) of the fire wall.

4. In buildings of Types II, III and IV construction, walls shall be permitted to terminate at the underside of combustible roof sheathing or decks, provided that all of the following requirements are met:

4.1. Roof openings are not less than 1220 mm (4 feet) from the fire wall.

4.2. The roof is covered with a minimum Class B roof covering.

4.3. The roof sheathing or deck is constructed of fire-retardant-treated wood for a distance of 1220 mm (4 feet) on both sides of the wall or the roof is protected with 15.9 mm (5/8-inch) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by not less than 51 mm (2-inch) nominal ledgers attached to the sides of the roof framing members for a distance of not less than 1220 mm (4 feet) on both sides of the fire wall.

5. In buildings designed in accordance with Clause 6.13.2, fire walls located above the 3-hour horizontal assembly required by Clause 6.13.2, Item 1 shall be permitted to extend from the top of this horizontal assembly.

6. Buildings with sloped roofs in accordance with Clause 8.6.6.2.

8.6.6.2 Buildings with sloped roofs.

Where a fire wall serves as an interior wall for a building, and the roof on one side or both sides of the fire wall slopes toward the fire wall at a slope greater than two units vertical in 12 units horizontal (2:12), the fire wall shall extend to a height equal to the height of the roof located 1219 mm (4 feet) from the fire wall plus 762 mm (30 inches). The extension of the fire wall shall be not less than 762 mm (30 inches).

8.6.7 Combustible framing in fire walls.

Adjacent combustible members entering into a concrete or masonry fire wall from opposite sides shall not have less than a 102 mm (4-inch) distance between embedded ends. Where combustible members frame into hollow walls or walls of hollow units, hollow spaces shall be solidly filled for the full thickness of the wall and for a distance not less than 102 mm (4 inches) above, below and between the structural members, with noncombustible materials approved for fireblocking.

8.6.8 Openings.

Each opening through a fire wall shall be protected in accordance with Clause 8.16 and shall not exceed 15 m² (156 square feet). The aggregate width of openings at any floor level shall not exceed 25 percent of the length of the wall.

Exceptions:

1. Openings are not permitted in party walls constructed in accordance with this Code.

2. Openings shall not be limited to 15 m² (156 square feet) where both buildings are equipped having a fire protection rating of not less than 3/4 hour.

Exception: Where the fire wall terminates at the underside of the roof sheathing, deck or slab of the lower roof, provided that:

1. The lower roof assembly within 3048 mm (10 feet) of the wall has not less than a 1-hour fire-resistance rating and the entire length and span of supporting elements for the rated roof assembly has a fire-resistance rating of not less than 1 hour.

2. Openings in the lower roof shall not be located within 10 feet (3048 mm) of the fire wall.
throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1.

8.6.9 Penetrations.
Penetrations of fire walls shall comply with Clause 8.14.

8.6.10 Joints.
Joints made in or between fire walls shall comply with Clause 8.15.

8.6.11 Ducts and air transfer openings.
Ducts and air transfer openings shall not penetrate fire walls.

Exception: Penetrations by ducts and air transfer openings of fire walls that are not on a plot line shall be allowed provided that the penetrations comply with Clause 8.17. The size and aggregate width of all openings shall not exceed the limitations of Clause 8.6.8.

8.7 FIRE BARRIERS

8.7.1 General.
Fire barriers installed as required elsewhere in this Code or the Ghana Fire Code shall comply with this clause.

8.7.2 Materials.
Fire barriers shall be of materials permitted by the building type of construction.

8.7.3 Fire-resistance rating.
The fire-resistance rating of fire barriers shall comply with this clause.

8.7.3.1 Shaft enclosures.
The fire-resistance rating of the fire barrier separating building areas from a shaft shall comply with Clause 8.13.4.

8.7.3.2 Interior exit stairway and ramp construction.
The fire-resistance rating of the fire barrier separating building areas from an interior exit stairway or ramp shall comply with Clause 11.23.1.

8.7.3.3 Enclosures for exit access stairways.
The fire-resistance rating of the fire barrier separating building areas from an exit access stairway or ramp shall comply with Clause 8.13.4.

8.7.3.4 Exit passageway.
The fire-resistance rating of the fire barrier separating building areas from an exit passageway shall comply with Clause 11.24.3.

8.7.3.5 Horizontal exit.
The fire-resistance rating of the separation between building areas connected by a horizontal exit shall comply with Clause 11.26.1.

8.7.3.6 Atriums.
The fire barrier separating atriums shall comply with Clause 404.6.

8.7.3.7 Incidental uses.
The fire barrier separating incidental uses from other spaces in the building shall have a fire-resistance rating of not less than that indicated in Table 6.12.

8.7.3.8 Control areas.
Fire barriers separating control areas shall have a fire-resistance rating of not less than that required in Clause 4.14.2.4.

8.7.3.9 Separated occupancies.
Where the provisions of Clause 6.11.4 are applicable, the fire barrier separating mixed occupancies shall have a fire-resistance rating of not less than that indicated in Table 508.4 based on the occupancies being separated.
8.7.3.10 Fire areas.

The fire barriers, fire walls or horizontal assemblies, or combination thereof, separating a single occupancy into different fire areas shall have a fire-resistance rating of not less than that indicated in Table 8.7.3.10. The fire barriers, fire walls or horizontal assemblies, or combination thereof, separating fire areas of mixed occupancies shall have a fire-resistance rating of not less than the highest value indicated in Table 8.7.3.10 for the occupancies under consideration.

8.7.4 Exterior walls.

Where exterior walls serve as a part of a required fire-resistance-rated shaft or stairway or ramp enclosure, or separation, such walls shall comply with the requirements of Clause 8.5 for exterior walls and the fire-resistance-rated enclosure or separation requirements shall not apply.

Exception: Exterior walls required to be fire-resistance rated in accordance with Clause 11.21 for exterior Escape balconies, Clause 11.23.7 for interior exit stairways and ramps and Clause 11.27.6 for exterior exit stairways and ramp.

8.7.5 Continuity.

Fire barriers shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above and shall be securely attached thereto. Such fire barriers shall be continuous through concealed space, such as the space above a suspended ceiling. Joints and voids at interclauses shall comply with Clauses 8.7.8 and 8.7.9.

Exceptions:
Shaft enclosures shall be permitted to terminate at a top enclosure complying with Clause 8.13.12.

1. Interior exit stairway and ramp enclosures required by Clause 11.23 and exit access stairway and ramp enclosures required by Clause 11.19 shall be permitted to terminate at a top enclosure complying with Clause 8.13.12.

8.7.5.1 Supporting construction.

The supporting construction for a fire barrier shall be protected to afford the required fire-resistance rating of the fire barrier supported. Hollow vertical spaces within a fire barrier shall be fireblocked in accordance with Clause 8.18.2 at every floor level.

Exceptions:

1. The maximum required fire-resistance rating for assemblies supporting fire barriers separating tank storage as provided for in Clause 4.15.9.1.2 shall be 2 hours, but not less than required by Table 7.1 for the building construction type.

2. Supporting construction for 1-hour fire barriers required by Table 509 in buildings of Types IIB, IIIB and VB construction is not required to be fire-resistance rated unless required by other clauses of this Code.

8.7.6 Openings.

Openings in a fire barrier shall be protected in accordance with Clause 8.16. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 15 m² (156 square feet). Openings in enclosures for exit access stairways and ramps, interior exit stairways and ramps and exit passageways shall also comply with Clauses 11.19, 11.23.4 and 11.24.5, respectively.

Exceptions:
1. Openings shall not be limited to 15 m² (156 square feet) where adjoining floor areas are equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

2. Openings shall not be limited to 15 m² (156 square feet) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire door serving enclosures for exit access stairways and ramps, and interior exit stairways and ramps.

3. Openings shall not be limited to 15 m² (156 square feet) or an aggregate width of 25 percent of the length of the wall where the opening protective has been tested in accordance with ASTM E119 and has a minimum fire-resistance rating not less than the fire-resistance rating of the wall.

4. Fire window assemblies permitted in atrium separation walls shall not be limited to a maximum aggregate width of 25 percent of the length of the wall.

5. Openings shall not be limited to 15 m² (156 square feet) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire door assembly in a fire barrier separating an enclosure for exit access stairways and ramps, and interior exit stairways and ramps from an exit passageway in accordance with Clause 11.23.3.1.

8.7.7 Penetrations.

Penetrations of fire barriers shall comply with Clause 8.14.

8.7.7.1 Prohibited penetrations.

Penetrations into enclosures for exit access stairways and ramps, interior exit stairways and ramps, and exit passageways shall be allowed only where permitted by Clauses 11.19, 11.23.5 and 11.24.6, respectively.

8.7.8 Joints.

Joints made in or between fire barriers, and joints made at the interclause of fire barriers with underside of a fire-resistance-rated floor or roof sheathing, slab or deck above, and the exterior vertical wall interclause shall comply with Clause 8.15.

8.7.9 Voids at interclauses.

The voids created at the interclause of a fire barrier and a nonfire-resistance-rated roof assembly or a nonfire-resistance-rated exterior wall assembly shall be filled. An approved material or system shall be used to fill the void, and shall be securely installed in or on the interclause for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.

8.7.10 Ducts and air transfer openings.

Penetrations in a fire barrier by ducts and air transfer openings shall comply with Clause 8.17.

8.8 FIRE PARTITIONS

8.8.1 General.

The following wall assemblies shall comply with this clause.

1. Separation walls as required by Clause 4.20.2 for Group I-1 and Group R occupancies.

2. Walls separating tenant spaces in covered and open mall buildings as required by Clause 4.2.4.2.1.

3. Corridor walls as required by Clause 11.20.1.

4. Enclosed elevator lobby separation as required by this Code.

5. Escape balconies as required by Clause 11.21.2

8.8.2 Materials.

The walls shall be of materials permitted by the building type of construction.

8.8.3 Fire-resistance rating.

Fire partitions shall have a fire-resistance rating of not less than 1 hour.
Exceptions:

1. Corridor walls permitted to have a 1/2-hour fire-resistance rating by Table 11.20.1.
2. Dwelling unit and sleeping unit separations in buildings of Types IB, IIB and IVB construction shall have fire-resistance ratings of not less than 1/2 hour in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

8.8.4 Continuity.

Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below and be securely attached to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. The underside of a floor/ceiling or roof/ceiling assembly having a fire-resistance rating that is not less than the fire-resistance rating of the fire partition.

Exceptions:

1. Fire partitions shall not be required to extend into a crawl space below where the floor above the crawl space has a minimum 1-hour fire-resistance rating.
2. Fire partitions serving as a corridor wall shall not be required to extend above the lower membrane of a corridor ceiling provided that the corridor ceiling membrane is equivalent to corridor wall membrane, and either of the following conditions is met:
   1. The room-side membrane of the corridor wall extends to the underside of the floor or roof sheathing, deck or slab above.
   2. The building is equipped with an automatic sprinkler system installed throughout in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2, including automatic sprinklers installed in the space between the top of the fire partition and underside of the floor or roof sheathing, deck or slab above.
3. Fire partitions serving as a corridor wall shall be permitted to terminate at the upper membrane of the corridor ceiling assembly where the corridor ceiling is constructed as required for the corridor wall.
4. Fire partitions separating tenant spaces in a covered or open mall building complying with Clause 4.2.4.2.1 shall not be required to extend above the underside of a ceiling. Such ceiling shall not be required to be part of a fire-resistance-rated assembly, and the attic or space above the ceiling at tenant separation walls shall not be required to be subdivided by fire partitions.

8.8.4.1 Supporting construction.

The supporting construction for a fire partition shall have a fire-resistance rating that is equal to or greater than the required fire-resistance rating of the supported fire partition.

Exception: In buildings of Types IB, IIB and IVB construction, the supporting construction requirement shall not apply to fire partitions separating tenant spaces in covered and open mall buildings, fire partitions separating dwelling units, fire partitions separating sleeping units and fire partitions serving as corridor walls.

8.8.4.2 Fireblocks and draftstops in combustible construction.

In combustible construction where fire partitions do not extend to the underside of the floor or roof sheathing, deck or slab above, the space above and along the line of the fire partition shall be provided with one of the following:

1. Fireblocking up to the underside of the floor or roof sheathing, deck or slab above using materials complying with Clause 8.18.2.1.
2. Draftstopping up to the underside of the floor or roof sheathing, deck or slab above using materials complying with Clause 8.18.3.1 for floors or Clause 8.18.4.1 for attics.
Exceptions:

1. Buildings equipped with an automatic sprinkler system installed throughout in accordance with Clause 10.3.3.1.1, or in accordance with Clause 10.3.3.1.2 provided that protection is provided in the space between the top of the fire partition and underside of the floor or roof sheathing, deck or slab above as required for systems complying with Clause 10.3.3.1.1.

2. Where corridor walls provide a sleeping unit or dwelling unit separation, drafstopping shall only be required above one of the corridor walls.

3. In Group R-2 occupancies with fewer than four dwelling units, fireblocking and draftstopping shall not be required.

4. In Group R-2 occupancies up to and including four stories in height in buildings not exceeding 60 feet (18 288 mm) in height above grade plane, the attic space shall be subdivided by draftstops into areas not exceeding 279 m² (3,000 square feet) or above every two dwelling units, whichever is smaller.

5. In Group R-3 occupancies with fewer than three dwelling units, fire-blocking and draftstopping shall not be required in floor assemblies.

8.8.5 Exterior walls.

Where exterior walls serve as a part of a required fire-resistance-rated separation, such walls shall comply with the requirements of Clause 8.5 for exterior walls, and the fire-resistance-rated separation requirements shall not apply.

Exception: Exterior walls required to be fire-resistance rated in accordance with Clause 11.21.2 for exterior Escape balconies, Clause 11.23.7 for interior exit stairways and ramps and Clause 11.27.6 for exterior exit stairways and ramps.

8.8.6 Openings.

Openings in a fire partition shall be protected in accordance with Clause 8.16.

8.8.7 Penetrations.

Penetrations of fire partitions shall comply with Clause 8.14.

8.8.8 Joints.

Joints made in or between fire partitions shall comply with Clause 8.15.

8.8.9 Ducts and air transfer openings.

Penetrations in a fire partition by ducts and air transfer openings shall comply with Clause 8.17.

8.9 SMOKE BARRIERS

8.9.1 General.

Vertical and horizontal smoke barriers shall comply with this clause.

8.9.2 Materials.

Smoke barriers shall be of materials permitted by the building type of construction.

8.9.3 Fire-resistance rating.

A 1-hour fire-resistance rating is required for smoke barriers.

Exception: Smoke barriers constructed of minimum 2.5 mm (0.10-inch-thick) steel in Group I-3 buildings.

8.9.4 Continuity.

Smoke barriers shall form an effective membrane continuous from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, deck or slab above, including continuity through concealed spaces, such as those found above suspended ceilings, and interstitial structural and mechanical spaces. The supporting construction shall be protected to afford the required fire-resistance rating of the wall or floor supported in buildings of other than Type I B, IIB or IVB construction. Smoke barrier walls used to separate smoke compartments shall comply with Clause 8.9.4.1. Smoke-barrier walls used to enclose areas of refuge in accordance with this Code or to enclose
8.9.4.1 Smoke-barrier walls separating smoke compartments.

Smoke-barrier walls used to separate smoke compartments shall form an effective membrane continuous from outside wall to outside wall.

8.9.4.2 Smoke-barrier walls enclosing areas of refuge or elevator lobbies.

Smoke-barrier walls used to enclose areas of refuge in accordance with this Code or to enclose elevator lobbies in accordance with this Code shall form an effective membrane enclosure that terminates at a fire barrier wall having a level of fire protection rating not less than 1 hour, another smoke barrier wall or an outside wall. A smoke and draft control door assembly as specified in Clause 8.16.2.2.1.1 shall not be required at each elevator hoistway door opening or at each exit doorway between an area of refuge and the exit enclosure.

8.9.5 Openings.

Openings in a smoke barrier shall be protected in accordance with Clause 8.16.

Exceptions:

1. In Group I-1, Condition 2, Group I-2 and ambulatory care facilities, where a pair of opposite-swinging doors are installed across a corridor in accordance with Clause 8.9.5.1, the doors shall not be required to be protected in accordance with Clause 8.16. The doors shall be close fitting within operational tolerances, and shall not have a center mullion or undercuts in excess of 19.1 mm (3/4 inch), louvers or grilles. The doors shall have head and jamb stops, and astragals or rabbets at meeting edges. Where permitted by the door manufacturer’s listing, positive-latching devices are not required.

Factory-applied or field-applied protective plates are not required to be labeled.

2. In Group I-1, Condition 2, Group I-2 and ambulatory care facilities, special purpose horizontal sliding, accordion or folding doors installed in accordance with Clause 11.10.1.4.3 and protected in accordance with Clause 8.16.

8.9.5.1 Group I-2 and ambulatory care facilities.

In Group I-2 and ambulatory care facilities, where doors protecting openings in smoke barriers are installed across a corridor and have hold-open devices, the doors shall be automatic-closing in accordance with Clause 8.16.2.6.6. Such doors shall have a vision panel with fire-protection-rated glazing materials in fire-protection-rated frames, the area of which shall not exceed that tested.

8.9.6 Penetrations.

Penetrations of smoke barriers shall comply with Clause 8.14.

8.9.7 Joints.

Joints made in or between smoke barriers shall comply with Clause 8.15.

8.9.8 Ducts and air transfer openings.

Penetrations in a smoke barrier by ducts and air transfer openings shall comply with Clause 8.17.

8.10 SMOKE PARTITIONS

8.10.1 General.

Smoke partitions installed as required elsewhere in the Code shall comply with this clause.

8.10.2 Materials.

The walls shall be of materials permitted by the building type of construction.
8.10.3 Fire-resistance rating.

Unless required elsewhere in the Code, smoke partitions are not required to have a fire-resistance rating.

8.10.4 Continuity.

Smoke partitions shall extend from the top of the foundation or floor below to the underside of the floor or roof sheathing, deck or slab above or to the underside of the ceiling above where the ceiling membrane is constructed to limit the transfer of smoke.

8.10.5 Openings.

Openings in smoke partitions shall comply with Clauses 8.10.5.1 and 8.10.5.2.

8.10.5.1 Windows.

Windows in smoke partitions shall be sealed to resist the free passage of smoke or be automatic-closing upon detection of smoke.

8.10.5.2 Doors.

Doors in smoke partitions shall comply with Clauses 8.10.5.2.1 through 8.10.5.2.3.

8.10.5.2.1 Louvers.

Doors in smoke partitions shall not include louvers.

8.10.5.2.2 Smoke and draft control doors.

Where required elsewhere in the Code, doors in smoke partitions shall meet the requirements for a smoke and draft control door assembly tested in accordance with this Code. The air leakage rate of the door assembly shall not exceed \(0.015424 \, \text{m}^3/(\text{s} \cdot \text{m}^2)\) (3.0 cubic feet per minute per square foot) of door opening at 24.9 Pa (0.10 inch) of water for both the ambient temperature test and the elevated temperature exposure test. Installation of smoke doors shall be in accordance with Ghana Fire Code.

8.10.5.2.2.1 Smoke and draft control door labeling.

Smoke and draft control doors complying with this Code shall be permitted to show the letter “S” on the manufacturer’s labeling.

8.10.5.2.3 Self- or automatic-closing doors.

Where required elsewhere in the Code, doors in smoke partitions shall be self- or automatic-closing by smoke detection in accordance with Code.

8.10.6 Penetrations.

The space around penetrating items shall be filled with an approved material to limit the free passage of smoke.

8.10.7 Joints.

Joints shall be filled with an approved material to limit the free passage of smoke.

8.10.8 Ducts and air transfer openings.

The space around a duct penetrating a smoke partition shall be filled with an approved material to limit the free passage of smoke. Air transfer openings in smoke partitions shall be provided with a smoke damper complying with Clause 8.17.3.2.2.

Exception: Where the installation of a smoke damper will interfere with the operation of a required smoke control system in accordance with Clause 10.9, approved alternative protection shall be utilized.

8.11 FLOOR AND ROOF ASSEMBLIES

8.11.1 General.

Horizontal assemblies shall comply with Clause 8.11.2. Nonfire-resistance-rated floor and roof assemblies shall comply with Clause 8.11.3.

8.11.2 Horizontal assemblies.

Horizontal assemblies shall comply with Clauses 8.11.2.1 through 8.11.2.6.
8.11.2.1 Materials.
Assemblies shall be of materials permitted by the building type of construction.

8.11.2.2 Continuity.
Assemblies shall be continuous without vertical openings, except as permitted by this clause and Clause 8.12.

8.11.2.3 Supporting construction.
The supporting construction shall be protected to afford the required fire-resistance rating of the horizontal assembly supported.

Exception: In buildings of Type IB, IIB or IVB construction, the construction supporting the horizontal assembly is not required to be fire-resistance rated at the following:

1. Horizontal assemblies at the separations of incidental uses as specified by this Code provided that the required fire-resistance rating does not exceed 1 hour.

2. Horizontal assemblies at the separations of dwelling units and sleeping units as required by Clause 4.20.3.

3. Horizontal assemblies at smoke barriers constructed in accordance with Clause 8.9.

8.11.2.4 Fire-resistance rating.
The fire-resistance rating of horizontal assemblies shall comply with Clauses 8.11.2.4.1 through 8.11.2.4.6 but shall be not less than that required by the building type of construction.

8.11.2.4.1 Separating mixed occupancies.
Where the horizontal assembly separates mixed occupancies, the assembly shall have a fire-resistance rating of not less than that required by Clause 6.11.4 based on the occupancies being separated.

8.11.2.4.2 Separating fire areas.
Where the horizontal assembly separates a single occupancy into different fire areas, the assembly shall have a fire-resistance rating of not less than that required by Clause 8.7.3.10.

8.11.2.4.3 Dwelling units and sleeping units.
Horizontal assemblies serving as dwelling or sleeping unit separations in accordance with Clause 4.20.3 shall be not less than 1-hour fire-resistance-rated construction.

Exception: Horizontal assemblies separating dwelling units and sleeping units shall be not less than 1/2-hour fire-resistance-rated construction in a building of Types IB, IIB and IVB construction, where the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

8.11.2.4.4 Separating smoke compartments.
Where the horizontal assembly is required to be a smoke barrier, the assembly shall comply with Clause 8.9.

8.11.2.4.5 Separating incidental uses.
Where the horizontal assembly separates incidental uses from the remainder of the building, the assembly shall have a fire-resistance rating of not less than that required by Clause 6.12.

8.11.2.4.6 Other separations.
Where a horizontal assembly is required by other clauses of this Code, the assembly shall have a fire-resistance rating of not less than that required by that clause.

8.11.2.5 Ceiling panels.
Where the weight of lay-in ceiling panels, used as part of fire-resistance-rated floor/ceiling or roof/ceiling assemblies, is not adequate to resist an upward force of 48 Pa (1 pound per square foot), wire or other approved devices shall be installed above the panels to prevent vertical displacement under such upward force.

8.11.2.6 Unusable space.
In 1-hour fire-resistance-rated floor/ceiling assemblies, the ceiling membrane is not required to be installed over unusable crawl
spaces. In 1-hour fire-resistance-rated roof assemblies, the floor membrane is not required to be installed where unusable attic space occurs above.

8.11.3 Nonfire-resistance-rated floor and roof assemblies.

Nonfire-resistance-rated floor, floor/ceiling, roof and roof/ceiling assemblies shall comply with Clauses 8.11.3.1 and 8.11.3.2.

8.11.3.1 Materials.
Assemblies shall be of materials permitted by the building type of construction.

8.11.3.2 Continuity.
Assemblies shall be continuous without vertical openings, except as permitted by Clause 8.12.

8.12 VERTICAL OPENINGS

8.12.1 General.
Each vertical opening shall comply in accordance with one of the protection methods in Clauses 8.12.1.1 through 8.12.1.16.

8.12.1.1 Shaft enclosures.
Vertical openings contained entirely within a shaft enclosure complying with Clause 8.13 shall be permitted.

8.12.1.2 Individual dwelling unit.
Unconcealed vertical openings totally within an individual residential dwelling unit and connecting four stories or less shall be permitted.

8.12.1.3 Escalator openings.
Where a building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, vertical openings for escalators shall be permitted where protected in accordance with Clause 8.12.1.3.1 or 8.12.1.3.2.

8.12.1.3.1 Opening size.
Protection by a draft curtain and closely spaced sprinklers in accordance with the Ghana Fire Code shall be permitted where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the escalator. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.

8.12.1.3.2 Automatic shutters.
Protection of the vertical opening by approved shutters at every penetrated floor shall be permitted in accordance with this clause. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Clause 10.7.3.1 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release therefrom.

8.12.1.4 Penetrations.
Penetrations, concealed and unconcealed, shall be permitted where protected in accordance with Clause 8.14.

8.12.1.5 Joints.
Joints shall be permitted where complying with Clause 8.12.1.5.1 or 8.12.1.5.2, as applicable.

8.12.1.5.1 Joints in or between horizontal assemblies.
Joints made in or between horizontal assemblies shall comply with Clause 8.15. The void created at the interclause of a floor/ceiling assembly and an exterior curtain wall assembly shall be permitted where protected in accordance with Clause 8.15.4.
8.12.1.5.2 Joints in or between nonfire-resistance-rated floor assemblies.

Joints in or between floor assemblies without a required fire-resistance rating shall be permitted where they comply with one of the following:

1. The joint shall be concealed within the cavity of a wall.

2. The joint shall be located above a ceiling.

3. The joint shall be sealed, treated or covered with an approved material or system to resist the free passage of flame and the products of combustion.

Exception: Joints meeting one of the exceptions listed in Clause 8.15.1.

8.12.1.6 Ducts and air transfer openings.

Penetrations by ducts and air transfer openings shall be protected in accordance with Clause 8.17. Grease ducts shall be protected in accordance with this Code.

8.12.1.7 Atriums.

In other than Group H occupancies, atriums complying with Clause 4.4 shall be permitted.

8.12.1.8 Masonry chimney.

Approved vertical openings for masonry chimneys shall be permitted where the annular space is fireblocked at each floor level in accordance with Clause 8.18.2.5.

8.12.1.9 Two-storey openings.

In other than Groups I-2 and I-3, a vertical opening that is not used as one of the applications listed in this clause shall be permitted if the opening complies with all of the following items:

1. Does not connect more than two stories.

2. Does not penetrate a horizontal assembly that separates fire areas or smoke barriers that separate smoke compartments.

3. Is not concealed within the construction of a wall or a floor/ceiling assembly.

4. Is not open to a corridor in Group I and R occupancies.

5. Is not open to a corridor on nonsprinklered floors.

6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures.

8.12.1.10 Parking garages.

Vertical openings in parking garages for automobile ramps, elevators and duct systems shall comply with Clause 8.12.1.10.1, 8.12.1.10.2 or 8.12.1.10.3, as applicable.

8.12.1.10.1 Automobile ramps.

Vertical openings for automobile ramps in parking garages shall be permitted where constructed in accordance with Clauses 4.6.5 and 4.6.6.

8.12.1.10.2 Elevators.

Vertical openings for elevator hoistways in parking garages that serve only the parking garage, and complying with Clauses 4.6.5 and 4.6.6, respectively, shall be permitted.

8.12.1.10.3 Duct systems.

Vertical openings for mechanical exhaust or supply duct systems in parking garages complying with Clauses 4.6.5 and 4.6.6, respectively, shall be permitted to be unenclosed where such duct system is contained within and serves only the parking garage.

8.12.1.11 Mezzanine.

Vertical openings between a mezzanine complying with this Code and the floor below shall be permitted.

8.12.1.12 Exit access stairways and ramps.

Vertical openings containing exit access stairways or ramps in accordance with this Code shall be permitted.
8.12.1.13 Openings.
Vertical openings for floor fire doors and access doors shall be permitted where protected by Clause 8.12.1.13.1 or 8.12.1.13.2.

8.12.1.13.1 Horizontal fire door assemblies.
Horizontal fire door assemblies used to protect openings in fire-resistance-rated horizontal assemblies shall be tested in accordance with the Ghana Fire Code, and shall achieve a fire-resistance rating not less than the assembly being penetrated. Horizontal fire door assemblies shall be labeled by an approved agency. The label shall be permanently affixed and shall specify the manufacturer, the test standard and the fire-resistance rating.

8.12.1.13.2 Access doors.
Access doors shall be permitted in ceilings of fire-resistance-rated floor/ceiling and roof/ceiling assemblies, provided that such doors are tested in accordance with ASTM E119 as horizontal assemblies and labeled by an approved agency for such purpose.

In Group I-3 occupancies, vertical openings shall be permitted in accordance with Clause 408.5.

8.12.1.15 Skylights.
Skylights and other penetrations through a fire-resistance-rated roof deck or slab are permitted to be unprotected, provided that the structural integrity of the fire-resistance-rated roof assembly is maintained. Unprotected skylights shall not be permitted in roof assemblies required to be fire-resistance rated in accordance with Clause 8.5.8.6. The supporting construction shall be protected to afford the required fire-resistance rating of the horizontal assembly supported.

8.12.1.16 Openings otherwise permitted.
Vertical openings shall be permitted where allowed by other clauses of this Code.

8.13 SHAFT ENCLOSURES

8.13.1 General.
The provisions of this clause shall apply to shafts required to protect openings and penetrations through floor/ceiling and roof/ceiling assemblies. Interior exit stairways and ramps shall be enclosed in accordance with Clause 11.23.

8.13.2 Construction.
Shaft enclosures shall be constructed as fire barriers in accordance with Clause 8.7 or horizontal assemblies in accordance with Clause 8.11, or both.

8.13.3 Materials.
The shaft enclosure shall be of materials permitted by the building type of construction.

8.13.4 Fire-resistance rating.
Shaft enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more, and not less than 1 hour where connecting less than four stories. The number of stories connected by the shaft enclosure shall include any basements but not any mezzanines. Shaft enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours. Shaft enclosures shall meet the requirements of Clause 8.3.2.1.

8.13.5 Continuity.
Shaft enclosures shall be constructed as fire barriers in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both, and shall have continuity in accordance with Clause 8.7.5 for fire barriers or Clause 8.11.2.2 for horizontal assemblies, as applicable.

8.13.6 Exterior walls.
Where exterior walls serve as a part of a required shaft enclosure, such walls shall comply with the requirements of Clause 8.5 for exterior walls and the fire-resistance-rated enclosure requirements shall not apply.
**Exception:** Exterior walls required to be fire-resistance rated in accordance with Clause 11.21.2 for exterior Escape balconies, Clause 11.23.7 for interior exit stairways and ramps and Clause 11.27.6 for exterior exit stairways and ramps.

**8.13.7 Openings.**

Openings in a shaft enclosure shall be protected in accordance with Clause 8.16 as required for fire barriers. Doors shall be self- or automatic-closing by smoke detection in accordance with Clause 8.16.2.6.6.

**8.13.7.1 Prohibited openings.**

Openings other than those necessary for the purpose of the shaft shall not be permitted in shaft enclosures.

**8.13.8 Penetrations.**

Penetrations in a shaft enclosure shall be protected in accordance with Clause 8.14 as required for fire barriers. Structural elements, such as beams or joists, where protected in accordance with Clause 8.14 shall be permitted to penetrate a shaft enclosure.

**8.13.8.1 Prohibited penetrations.**

Penetrations other than those necessary for the purpose of the shaft shall not be permitted in shaft enclosures.

**Exception:** Membrane penetrations shall be permitted on the outside of shaft enclosures. Such penetrations shall be protected in accordance with Clause 8.14.4.2.

**8.13.9 Joints.**

Joints in a shaft enclosure shall comply with Clause 8.15.

**8.13.10 Duct and air transfer openings.**

Penetrations of a shaft enclosure by ducts and air transfer openings shall comply with Clause 717.

**8.13.11 Enclosure at the bottom.**

Shafts that do not extend to the bottom of the building or structure shall comply with one of the following:

1. They shall be enclosed at the lowest level with construction of the same fire-resistance rating as the lowest floor through which the shaft passes, but not less than the rating required for the shaft enclosure.

2. They shall terminate in a room having a use related to the purpose of the shaft. The room shall be separated from the remainder of the building by fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. The fire-resistance rating and opening protective shall be not less than the protection required for the shaft enclosure.

3. They shall be protected by approved fire dampers installed in accordance with their listing at the lowest floor level within the shaft enclosure.

**Exceptions:**

1. The fire-resistance-rated room separation is not required, provided that the only openings in or penetrations of the shaft enclosure to the interior of the building occur at the bottom. The bottom of the shaft shall be closed off around the penetrating items with materials permitted by Clause 8.18.3.1 for draftstopping, or the room shall be provided with an approved automatic sprinkler system.

2. A shaft enclosure containing a waste or linen chute shall not be used for any other purpose and shall discharge in a room protected in accordance with Clause 8.13.13.4.

3. The fire-resistance-rated room separation and the protection at the bottom of the shaft are not required provided that there are no combustibles in the shaft and there are no openings or other penetrations through the shaft enclosure to the interior of the building.
8.13.12 Enclosure at top.
A shaft enclosure that does not extend to the underside of the roof sheathing, deck or slab of the building shall be enclosed at the top with construction of the same fire-resistance rating as the topmost floor penetrated by the shaft, but not less than the fire-resistance rating required for the shaft enclosure.

8.13.13 Waste and linen chutes and incinerator rooms.

Exception: Chutes serving and contained within a single dwelling unit.

A shaft enclosure containing a recycling, or waste or linen chute shall not be used for any other purpose and shall be enclosed in accordance with Clause 8.13.4. A shaft enclosure shall be permitted to contain recycling and waste chutes. Openings into the shaft, from access rooms and discharge rooms, shall be protected in accordance with this clause and Clause 8.16. Openings into chutes shall not be located in corridors. Doors into chutes shall be self-closing. Discharge doors shall be self- or automatic-closing upon the actuation of a smoke detector in accordance with Clause 8.16.2.6.6, except that heat-activated closing devices shall be permitted between the shaft and the discharge room.

8.13.13.2 Materials.
A shaft enclosure containing a waste, recycling, or linen chute shall be constructed of materials as permitted by the building type of construction.

8.13.13.3 Chute access rooms.
Access openings for waste or linen chutes shall be located in rooms or compartments enclosed by not less than 1-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. Openings into the access rooms shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour. Doors shall be self- or automatic-closing upon the detection of smoke in accordance with Clause 8.16.2.6.6. The room or compartment shall be configured to allow the access door to the room or compartment to close and latch with the access panel to the refuse or laundry chute in any position.

8.13.13.4 Chute discharge room.
Waste or linen chutes shall discharge into an enclosed room separated by fire barriers with a fire-resistance rating not less than the required fire rating of the shaft enclosure and constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. Openings into the discharge room from the remainder of the building shall be protected by opening protectives having a fire protection rating equal to the protection required for the shaft enclosure. Doors shall be self- or automatic-closing upon the detection of smoke in accordance with Clause 8.16.2.6.6. Waste chutes shall not terminate in an incinerator room. Waste and linen rooms that are not provided with chutes need only comply with Table 509.

8.13.13.5 Incinerator room.
Incinerator rooms shall comply with this Code.

8.13.13.6 Automatic sprinkler system.
An approved automatic sprinkler system shall be installed in accordance with Clause 10.3.2.11.2.

8.13.14 Elevator, dumbwaiter and other hoistways.
Elevator, dumbwaiter and other hoistway enclosures shall be constructed in accordance with Clauses 712 and 713, and Part 30.

8.14 PENETRATIONS

8.14.1 Scope.
The provisions of this clause shall govern the materials and methods of construction used to protect through penetrations and membrane
8.14.1 Ducts and air transfer openings.

Penetrations of fire-resistance-rated walls by ducts that are not protected with dampers shall comply with Clauses 8.14.3 through 8.14.4.3. Penetrations of horizontal assemblies not protected with a shaft as permitted by Clause 8.17.6, and not required to be protected with fire dampers by other clauses of this Code, shall comply with Clauses 8.14.5 through 8.14.6.2. Ducts and air transfer openings that are protected with dampers shall comply with Clause 8.17.

8.14.2 Installation.

A listed penetration firestop system shall be installed in accordance with the manufacturer's installation instructions and the listing criteria.

8.14.3 Installation details.

Where sleeves are used, they shall be securely fastened to the assembly penetrated. The space between the item contained in the sleeve and the sleeve itself and any space between the sleeve and the assembly penetrated shall be protected in accordance with this clause. Insulation and coverings on or in the penetrating item shall not penetrate the assembly unless the specific material used has been tested as part of the assembly in accordance with this clause.

Penetrations into or through fire walls, fire barriers, smoke barrier walls and fire partitions shall comply with Clauses 8.14.4.1 through 8.14.4.3. Penetrations in smoke barrier walls shall also comply with Clause 8.14.5.4.

8.14.4.1 Through penetrations.

Through penetrations of fire-resistance-rated walls shall comply with Clause 8.14.4.1.1 or 8.14.4.1.2.

Exception: Where the penetrating items are steel, ferrous or copper pipes, tubes or conduits, the annular space between the penetrating item and the fire-resistance-rated wall is permitted to be protected by either of the following measures:

1. In concrete or masonry walls where the penetrating item is a maximum 152 mm (6-inch) nominal diameter and the area of the opening through the wall does not exceed 0.0929 m² (144 square inches), concrete, grout or mortar is permitted where installed the full thickness of the wall or the thickness required to maintain the fire-resistance rating.

2. The material used to fill the annular space shall prevent the passage of flame and hot gases sufficient to ignite cotton waste when subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 2.49 Pa (0.01 inch) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.

8.14.4.1.1 Fire-resistance-rated assemblies.

Through penetrations shall be protected using systems installed as tested in the approved fire-resistance-rated assembly.

8.14.4.1.2 Through-penetration firestop system.

Through penetrations shall be protected by an approved penetration firestop system installed as tested in accordance with ASTM E814, with a minimum positive pressure differential of 2.49 Pa (0.01 inch) of water and shall have an F rating of not less than the required fire-resistance rating of the wall penetrated.

8.14.4.2 Membrane penetrations.

Membrane penetrations shall comply with Clause 8.14.4.1. Where walls or partitions are required to have a fire-resistance rating, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 0.0103 m² (16 square inches) in area, provided that the aggregate area of the openings through the membrane does not exceed 0.0645 m² (100 square inches) in any 9.29 m² (100
such boxes on opposite sides of the wall or partition shall be separated by one of the following:

1.1. By a horizontal distance of not less than 610 mm (24 inches) where the wall or partition is constructed with individual noncommunicating stud cavities.

1.2. By a horizontal distance of not less than the depth of the wall cavity where the wall cavity is filled with cellulose loose-fill, rockwool or slag mineral wool insulation.

1.3. By solid fireblocking in accordance with Clause 8.18.2.1.

1.4. By protecting both outlet boxes with listed putty pads.

1.5. By other listed materials and methods.

2. Membrane penetrations by listed electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the wall membrane and the box shall not exceed 3.2 mm (1/8 inch) unless listed otherwise. Such boxes on opposite sides of the wall or partition shall be separated by one of the following:

2.1. By the horizontal distance specified in the listing of the electrical boxes.

2.2. By solid fireblocking in accordance with Clause 8.18.2.1.

2.3. By protecting both boxes with listed putty pads.

2.4. By other listed materials and methods.

3. Membrane penetrations by electrical boxes of any size or type, that have been listed as part of a wall opening protective material system for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.

4. Membrane penetrations by boxes other than electrical boxes, provided that such penetrating items and the annular space between the wall membrane and the box, are protected by an approved membrane penetration firestop system installed as tested in accordance with ASTM E814, with a minimum positive pressure differential of 2.49 Pa (0.01 inch) of water, and shall have an F and T rating of not less than the required fire-resistance rating of the wall penetrated and be installed in accordance with their listing.

5. The annular space created by the penetration of an automatic sprinkler, provided that it is covered by a metal escutcheon plate.

6. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that exceed 0.0103 m² (16 square inches) in area, or steel electrical boxes of any size having an aggregate area through the membrane exceeding 0.0645 m² (100 square inches) in any 9.29 m² (100 square feet) of wall area, provided that such penetrating items are protected by listed putty pads or other listed materials and methods, and installed in accordance with the listing.

8.14.4.3 Dissimilar materials.

Noncombustible penetrating items shall not connect to combustible items beyond the point of firestopping unless it can be demonstrated that the fire-resistance integrity of the wall is maintained.

8.14.5 Horizontal assemblies.

Penetrations of a fire-resistance-rated floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly not required to be enclosed in a shaft by Clause 8.12.1 shall be protected in accordance with Clauses 8.14.5.1 through 8.14.5.4.

8.14.5.1 Through penetrations.

Through penetrations of horizontal assemblies shall comply with this Code.

Exceptions:

1. Penetrations by steel, ferrous or copper conduits, pipes, tubes or vents or concrete or masonry items through a single fire-resistance-rated floor assembly where the annular space is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste when subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 2.49 Pa (0.01 inch) of water at the location of the penetration for the time period equivalent to the
fire-resistance rating of the construction penetrated. Penetrating items with a maximum 152 mm (6-inch) nominal diameter shall not be limited to the penetration of a single fire-resistance-rated floor assembly, provided that the aggregate area of the openings through the assembly does not exceed 92,900 mm² (144 square inches) in any 9.3 m² (100 square feet) of floor area.

2. Penetrations in a single concrete floor by steel, ferrous or copper conduits, pipes, tubes or vents with a maximum 152 mm (6-inch) nominal diameter, provided that the concrete, grout or mortar is installed the full thickness of the floor or the thickness required to maintain the fire-resistance rating. The penetrating items shall not be limited to the penetration of a single concrete floor, provided that the area of the opening through each floor does not exceed 92,900 mm² (144 square inches).

3. Penetrations by listed electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and installed in accordance with the instructions included in the listing.

8.14.5.1.1 Fire-resistance-rated assemblies.

Through penetrations shall be protected using systems installed as tested in the approved fire-resistance-rated assembly.

8.14.5.1.2 Through-penetration firestop system.

Through penetrations shall be protected by an approved through-penetration firestop system installed and tested in accordance with ASTM E814, with a minimum positive pressure differential of 0.01 inch of water (2.49 Pa). The system shall have an F rating/T rating of not less than 1 hour but not less than the required rating of the floor penetrated.

Exceptions:

1. Floor penetrations contained and located within the cavity of a wall above the floor or below the floor do not require a T rating.

2. Floor penetrations by floor drains, tub drains or shower drains contained and located within the concealed space of a horizontal assembly do not require a T rating.

3. Floor penetrations of maximum 102 mm (4-inch) nominal diameter metal conduit or tubing penetrating directly into metal-enclosed electrical power switchgear do not require a T rating.

8.14.5.2 Membrane penetrations.

Penetrations of membranes that are part of a horizontal assembly shall comply with Clause 8.14.5.1.1 or 8.14.5.1.2. Where floor/ceiling assemblies are required to have a fire-resistance rating, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or masonry items where the annular space is protected either in accordance with Clause 8.14.5.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 64,500 mm² (100 square inches) in any 9.3 m² (100 square feet) of ceiling area in assemblies tested without penetrations.

2. Ceiling membrane penetrations of maximum 2-hour horizontal assemblies by steel electrical boxes that do not exceed 10,323 mm² (16 square inches) in area, provided that the aggregate area of such penetrations does not exceed 44,500 mm² (100 square inches) in any 100 square feet (9.29 m²) of ceiling area, and the annular space between the ceiling membrane and the box does not exceed 3.2 mm (1/8 inch).

3. Membrane penetrations by electrical boxes of any size or type that have been listed as part of an opening protective material system for use in horizontal assemblies and are installed in accordance with the instructions included in the listing.

4. Membrane penetrations by listed electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the ceiling membrane...
and the box shall not exceed 3.2 mm (1/8 inch) unless listed otherwise.

5. The annular space created by the penetration of a fire sprinkler, provided that it is covered by a metal escutcheon plate.

6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.

7. The ceiling membrane of 1- and 2-hour fire-resistance-rated horizontal assemblies is permitted to be interrupted with the double wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard, provided that all penetrating items through the double top plates are protected in accordance with Clause 8.14.5.1.1 or 8.14.5.1.2 and the ceiling membrane is tight to the top plates.

8. Ceiling membrane penetrations by listed luminaires (light fixtures) or by luminaires protected with listed materials, which have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.

8.14.5.3 Dissimilar materials.

Noncombustible penetrating items shall not connect to combustible materials beyond the point of firestopping unless it can be demonstrated that the fire-resistance integrity of the horizontal assembly is maintained.

8.14.5.4 Penetrations in smoke barriers.

Penetrations in smoke barriers shall be protected by an approved through-penetration firestop system installed and tested in accordance with the requirements of UL 1479 for air leakage. The L rating of the system measured at 7.47 Pa (0.30 inch) of water in both the ambient temperature and elevated temperature tests shall not exceed either of the following:

1. 0.025 m³/s · m² (5.0 cfm per square foot) of penetration opening for each through-penetration firestop system.

2. A total cumulative leakage of 50 cfm (0.024 m³/s) for any 9.3m² (100 square feet) of wall area, or floor area.

8.14.6 Nonfire-resistance-rated assemblies.

Penetrations of nonfire-resistance-rated floor or floor/ceiling assemblies or the ceiling membrane of a nonfire-resistance-rated roof/ceiling assembly shall meet the requirements of Clause 8.13 or shall comply with Clause 8.14.6.1 or 8.14.6.2.

8.14.6.1 Noncombustible penetrating items.

Noncombustible penetrating items that connect not more than five stories are permitted, provided that the annular space is filled to resist the free passage of flame and the products of combustion with an approved noncombustible material or with a fill, void or cavity material that is tested and classified for use in through-penetration firestop systems.

8.14.6.2 Penetrating items.

Penetrating items that connect not more than two stories are permitted, provided that the annular space is filled with an approved material to resist the free passage of flame and the products of combustion.

8.15 FIRE-RESISTANT JOINT SYSTEMS

8.15.1 General.

Joints installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved fire-resistant joint system designed to resist the passage of fire for a time period not less than the required fire-resistance rating of the wall, floor or roof in or between which the system is installed. Fire-resistant joint systems shall be tested in accordance with Clause 8.15.3.

Exception: Fire-resistant joint systems shall not be required for joints in all of the following locations:

1. Floors within a single dwelling unit.
2. Floors where the joint is protected by a shaft enclosure in accordance with Clause 8.13.

3. Floors within atriums where the space adjacent to the atrium is included in the volume of the atrium for smoke control purposes.

4. Floors within malls.

5. Floors and ramps within parking garages or structures constructed in accordance with Clause 4.6.5 and 4.6.6.

7. Walls that are permitted to have unprotected openings.

8. Roofs where openings are permitted.

9. Control joints not exceeding a maximum width of 15.9 mm (0.625 inch) and tested in accordance with ASTM E119.

10. The interclause of exterior curtain wall assemblies and the roof slab or roof deck.

8.15.1.1 Curtain wall assembly.

The void created at the interclause of a floor/ceiling assembly and an exterior curtain wall assembly shall be protected in accordance with Clause 8.15.4.

8.15.2 Installation.

A fire-resistant joint system shall be securely installed in accordance with the manufacturer’s installation instructions and the listing criteria in or on the joint for its entire length so as not to impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases.

8.15.3 Fire test criteria.

Fire-resistant joint systems shall be tested in accordance with the requirements of either ASTM E1966. Nonsymmetrical wall joint systems shall be tested with both faces exposed to the furnace, and the assigned fire-resistance rating shall be the shortest duration obtained from the two tests. Where evidence is furnished to show that the wall was tested with the least fire-resistant side exposed to the furnace, subject to acceptance of the building official, the wall need not be subjected to tests from the opposite side.

**Exception:** For exterior walls with a horizontal fire separation distance greater than 10 feet (3048 mm), the joint system shall be required to be tested for interior fire exposure only.

8.15.4 Exterior curtain wall/floor interclause.

Where fire-resistance-rated floor or floor/ceiling assemblies are required, voids created at the interclause of the exterior curtain wall assemblies and such floor assemblies shall be sealed with an approved system to prevent the interior spread of fire. Such systems shall be securely installed and tested in accordance with ASTM E2307 to provide an F rating for a time period not less than the fire-resistance rating of the floor assembly. Height and fire-resistance requirements for curtain wall spandrels shall comply with Clause 8.5.8.5.

**Exception:** Voids created at the interclause of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be sealed with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the fire-resistance rating of the floor assembly.

8.15.4.1 Exterior curtain wall/nonfire-resistance-rated floor assembly interclauses.

Voids created at the interclause of exterior curtain wall assemblies and nonfire-resistance-rated floor or floor/ceiling assemblies shall be sealed with an approved material or system to retard the interior spread of fire and hot gases between stories.

8.15.4.2 Exterior curtain wall/vertical fire barrier interclauses.

Voids created at the interclause of nonfire-resistance-rated exterior curtain wall
8.15.5 Spandrel wall.

Height and fire-resistance requirements for curtain wall spandrels shall comply with Clause 8.5.8.5. Where Clause 8.5.8.5 does not require a fire-resistance-rated spandrel wall, the requirements of this Code shall still apply to the interclause between the spandrel wall and the floor.

8.15.6 Fire-resistant joint systems in smoke barriers.

Fire-resistant joint systems in smoke barriers, and joints at the interclause of a horizontal smoke barrier and an exterior curtain wall, shall be tested in accordance with the requirements of UL 2079 for air leakage. The L rating of the joint system shall not exceed 0.00775 m³/s m (5 cfm per linear foot) of joint at 7.47 Pa (0.30 inch) of water for both the ambient temperature and elevated temperature tests.

8.16 OPENING PROTECTIVES

### 8.16.1 General.

Opening protectives required by other clauses of this Code shall comply with the provisions of this clause and shall be installed in accordance with this Code.

TABLE 8.16.1(2)—continued
OPENING FIRE PROTECTION ASSEMBLIES, RATINGS AND MARKINGS

242
a. Two doors, each with a fire protection rating of 11/2 hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.
b. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Clause 8.16.1.2.3 shall be permitted, in the maximum size tested.
c. Under the column heading “Fire-rated glazing marking door vision panel,” W refers to the fire-resistance rating of the glazing, not the frame.
d. See Clause 8.16.2.5.1.2.1.
e. See Clause 8.16.1.2.2.1 and Table 8.16.1(1) for additional permitted markings.

**Notes:**
- NP = Not Permitted.
- W-XXX = The fire rating duration period in minutes, which shall be equal to the fire-resistance rating required for the wall assembly.
8.16.1.1 Alternative methods for determining fire protection ratings.

The application of any of the alternative methods listed in this clause shall be based on the fire exposure and acceptance criteria specified in the Ghana Fire Code. The required fire resistance of an opening protective shall be permitted to be established by any of the following methods or procedures:

1. Designs documented in approved sources.
2. Calculations performed in an approved manner.
3. Engineering analysis based on a comparison of opening protective designs having fire protection ratings as determined by the test procedures set forth in the Ghana Fire Code.
4. Alternative protection methods as allowed by Clause 11.4.11.

8.16.1.2 Glazing.

Glazing used in fire door assemblies and fire window assemblies shall comply with this clause in addition to the requirements of Clauses 8.16.2 and 8.16.3, respectively.

8.16.1.2.1 Safety glazing.

Fire-protection-rated glazing and fire-resistance-rated glazing installed in fire door assemblies and fire window assemblies shall comply with the safety glazing requirements of Part 25 where applicable.

8.16.1.2.2 Marking fire-rated glazing assemblies.

Fire-rated glazing assemblies shall be marked in accordance with Tables 8.16.1(1), 8.16.1(2) and 8.16.1(3).

8.16.1.2.2.1 Fire-rated glazing identification.

For fire-rated glazing, the label shall bear the identification required in Tables 8.16.1(1) and 8.16.1(2). “D” indicates that the glazing is permitted to be used in fire door assemblies and meets the fire protection requirements of the Ghana Fire Code. “H” indicates that the glazing meets the hose stream requirements of the Ghana Fire Code. “T” indicates that the glazing meets the temperature requirements of Clause 8.16.2.2.3.1. The placeholder “XXX” represents the fire-rating period, in minutes.

8.16.1.2.2.2 Fire-protection-rated glazing identification.

For fire-protection-rated glazing, the label shall bear the following identification required in Tables 8.16.1(1) and 8.16.1(3): “OH – XXX.” “OH” indicates that the glazing meets both the fire protection and the hose-stream requirements of the Ghana Fire Code and is permitted to be used in fire window openings. The placeholder “XXX” represents the fire-rating period, in minutes.

8.16.1.2.2.3 Fire-resistance-rated glazing identification.

For fire-resistance-rated glazing, the label shall bear the identification required in Clause 8.03.6 and Table 8.16.1(1).

8.16.1.2.2.4 Fire-rated glazing that exceeds the Code requirements.

Fire-rated glazing assemblies marked as complying with hose stream requirements (H) shall be permitted in applications that do not require compliance with hose stream requirements. Fire-rated glazing assemblies marked as complying with temperature rise requirements (T) shall be permitted in applications that do not require compliance with temperature rise requirements. Fire-rated glazing assemblies marked with ratings (XXX) that exceed the ratings required by this Code shall be permitted.

8.16.1.2.3 Fire-resistance-rated glazing.

Fire-rated glazing tested as part of a fire-resistance-rated wall or floor/ceiling assembly in accordance with ASTM E119 and labeled in accordance with Clause 8.3.6 shall otherwise be required to comply with this clause where used as part of a wall or floor/ceiling assembly.
8.16.1.2.3.1 Glazing in fire door and fire window assemblies.

Fire-resistance-rated glazing shall be permitted in fire door and fire window assemblies where tested and installed in accordance with their listings and where in compliance with the requirements of this clause.

8.16.2 Fire door assemblies.

Fire door assemblies required by other clauses of this Code shall comply with the provisions of this clause. Fire door frames with transom lights, sidelights or both shall be permitted in accordance with Clause 8.16.2.5.4.

8.16.2.1 Testing requirements.

Approved fire door and fire shutter assemblies shall be constructed of any material or assembly of component materials that conforms to the test requirements of Clauses 8.16.2.1.1 through 8.16.2.1.4 and the fire protection rating indicated in Table 8.16.1(2).

Exceptions:

1. Labeled protective assemblies that conform to the requirements of this clause for tin-clad fire door assemblies.

2. Floor fire door assemblies in accordance with Clause 8.12.1.13.1.

8.16.2.1.1 Side-hinged or pivoted swinging doors.

Fire door assemblies with side-hinged and pivoted swinging doors shall be tested in accordance with the Ghana Fire Code. For tests conducted in accordance with the Ghana Fire Code, the fire test shall be conducted using the positive pressure method specified in the standard.

8.16.2.1.2 Other types of assemblies.

Fire door assemblies with other types of doors, including swinging elevator doors, horizontal sliding fire doors, rolling steel fire doors, fire shutters, bottom- and side-hinged chute intake doors, and top-hinged chute discharge doors, shall be tested in accordance with the Ghana Fire Code. For tests conducted in accordance with the Ghana Fire Code, the neutral pressure plane in the furnace shall be maintained as nearly equal to the atmospheric pressure as possible at the top of the door, as specified in the standard.

8.16.2.1.3 Glazing in transoms lights and sidelights in corridors and smoke barriers.

Glazing material in any other part of the door assembly, including transom lights and sidelights, shall be tested in accordance with the Ghana Fire Code, including the hose stream test, in accordance with Clause 8.16.3.1.1.

8.16.2.1.4 Smoke and draft control.

Fire door assemblies that serve as smoke and draft control assemblies shall be tested in accordance with this Code.

8.16.2.2 Performance requirements.

Fire door assemblies shall be installed in the assemblies specified in Table 8.16.1(2) and shall comply with the fire protection rating specified.

8.16.2.2.1 Door assemblies in corridors and smoke barriers.

Fire door assemblies required to have a minimum fire protection rating of 20 minutes where located in corridor walls or smoke barrier walls having a fire-resistance rating in accordance with Table 8.16.1(2) shall be tested in accordance with the Ghana Fire Code, without the hose stream test.

Exceptions:

1. Viewports that require a hole not larger than 25 mm (1 inch) in diameter through the door, have not less than a 6.4 mm (0.25-inch-thick) glass disc and the holder is of metal that will not melt out where subject to temperatures of 927°C (1,700°F).

2. Corridor door assemblies in occupancies of Group I-2 shall be in accordance with Clause 4.7.3.1.

3. Unprotected openings shall be permitted for corridors in multitheater
complexes where each motion picture auditorium has not less than one-half of its required exit or exit access doorways opening directly to the exterior or into an exit passageway.

4. Horizontal sliding doors in smoke barriers that comply with Clauses 4.8.6 and 4.8.8.4 in occupancies in Group I-3.

8.16.2.2.1.1 Smoke and draft control.

The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot (0.01524 m³/s × m²) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited.

8.16.2.2 Door assemblies in other fire partitions.

Fire door assemblies required to have a minimum fire protection rating of 20 minutes where located in other fire partitions having a fire-resistance rating of 0.5 hour in accordance with Table 8.16.1(2) shall be tested in accordance with the Ghana Fire Code, with the hose stream test.

8.16.2.2.3 Doors in interior exit stairways and ramps and exit passageways.

Fire door assemblies in interior exit stairways and ramps and exit passageways shall have a maximum transmitted temperature rise of not more than 250°C (450°F) above ambient at the end of 30 minutes of standard fire test exposure.

Exception: The maximum transmitted temperature rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

8.16.2.2.3.1 Glazing in doors.

Fire-protection-rated glazing in excess of 100 square inches (0.065 m²) is not permitted. Fire-resistance-rated glazing in excess of 0.065 m² (100 square inches) shall be permitted in fire doors. Listed fire-resistance-rated glazing in a fire door shall have a maximum transmitted temperature rise in accordance with Clause 8.16.2.2.3 when the fire door is tested in accordance with the Ghana Fire Code.

8.16.2.3 Fire doors.

Fire doors installed within a fire door assembly shall meet the fire rating indicated in Table 8.16.1(2).

8.16.2.4 Fire door frames.

Fire door frames installed as part of a fire door assembly shall meet the fire rating indicated in Table 8.16.1(2).

8.16.2.5 Glazing in fire door assemblies.

Fire-rated glazing conforming to the opening protection requirements in Clause 8.16.2.1 shall be permitted in fire door assemblies.

8.16.2.5.1 Size limitations.

Fire-resistance-rated glazing shall comply with the size limitations in Clause 8.16.2.5.1.1. Fire-protection-rated glazing shall comply with the size limitations of the Ghana Fire Code, and as provided in Clause 8.16.2.5.1.2.

8.16.2.5.1.1 Fire-resistance-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour.

Fire-resistance-rated glazing tested to ASTM E119 shall be permitted in fire door assemblies located in fire walls and in fire barriers in accordance with Table 8.16.1(2) to the maximum size tested and in accordance with their listings.

8.16.2.5.1.2 Fire-protection-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour.

Fire-protection-rated glazing shall be prohibited in fire walls and fire barriers except as provided in Clauses 8.16.2.5.1.2.1 and 8.16.2.5.1.2.2.

8.16.2.5.1.2.1 Horizontal exits.

Fire-protection-rated glazing shall be permitted as vision panels in self-closing swinging fire door assemblies serving as horizontal exits in fire walls where limited to 0.065 m² (100 square inches).
8.16.2.5.1.2.2 Fire barriers.

Fire-protection-rated glazing shall be permitted in fire doors having a 1 1/2-hour fire protection rating intended for installation in fire barriers, where limited to 0.065 m² (100 square inches).

8.16.2.5.2 Elevator, stairway and ramp protective.

Approved fire-protection-rated glazing used in fire door assemblies in elevator, stairway and ramp enclosures shall be so located as to furnish clear vision of the passageway or approach to the elevator, stairway or ramp.

8.16.2.5.3 Glazing in door assemblies in corridors and smoke barriers.

In a 20-minute fire door assembly, the glazing material in the door itself shall have a minimum fire-protection-rated glazing of 20 minutes and shall be exempt from the hose stream test.

8.16.2.5.4 Fire door frames with transom lights and sidelights.

Fire-protection-rated glazing shall be permitted in door frames with transom lights, sidelights or both, where a 3/4-hour fire protection rating or less is required and in 2-hour fire-resistance-rated exterior walls in accordance with Table 8.16.1(2). Fire door frames with transom lights, sidelights, or both, installed with fire-resistance-rated glazing tested as an assembly in accordance with ASTM E119 shall be permitted where a fire protection rating exceeding 3/4 hour is required in accordance with Table 8.16.1(2).

8.16.2.6 Fire door hardware and closures.

Fire door hardware and closures shall be installed on fire door assemblies in accordance with the requirements of this clause.

8.16.2.6.1 Door closing.

Fire doors shall be latching and self- or automatic-closing in accordance with this clause.

Exceptions:

1. Fire doors located in common walls separating sleeping units in Group R-1 shall be permitted without automatic- or self-closing devices.

2. The elevator car doors and the associated hoistway enclosure doors at the floor level designated for recall in accordance with this Code shall be permitted to remain open during Phase I emergency recall operation.

8.16.2.6.2 Latch required.

Unless otherwise specifically permitted, single side-hinged swinging fire doors and both leaves of pairs of side-hinged swinging fire doors shall be provided with an active latch bolt that will secure the door when it is closed.

8.16.2.6.3 Chute intake door latching.

Chute intake doors shall be positive latching, remaining latched and closed in the event of latch spring failure during a fire emergency.

8.16.2.6.4 Automatic-closing fire door assemblies.

Automatic-closing fire door assemblies shall be self-closing in accordance with the Ghana Fire Code.

8.16.2.6.5 Delayed-action closers.

Doors required to be self-closing and not required to be automatic closing shall be permitted to be equipped with delayed-action closers.

8.16.2.6.6 Smoke-activated doors.

Automatic-closing doors installed in the following locations shall be permitted to have hold-open devices. Doors shall automatically close by the actuation of smoke detectors installed in accordance with Clause 10.7.3 or by loss of power to the smoke detector or hold-open device. Doors that are automatic-closing by smoke detection shall not have more than a 10-second delay before the door starts to close after the smoke detector is actuated. Automatic-closing doors that protect openings installed in the following locations shall comply with this clause:
1. In walls that separate incidental uses in accordance with this Code.

2. In fire walls in accordance with Clause 8.6.8.

3. In fire barriers in accordance with Clause 8.7.6.

4. In fire partitions in accordance with Clause 8.8.6.

5. In smoke barriers in accordance with Clause 8.9.5.

6. In smoke partitions in accordance with Clause 8.10.5.2.3.

7. In shaft enclosures in accordance with Clause 8.13.7.

8. In waste and linen chutes, discharge openings and access and discharge rooms in accordance with Clause 8.13.13. Loading doors installed in waste and linen chutes shall meet the requirements of Clauses 8.16.2.6.1 and 8.16.2.6.3.

8.16.2.6.7 Doors in pedestrian ways.

Vertical sliding or vertical rolling steel fire doors in openings through which pedestrians travel shall be heat activated or activated by smoke detectors with alarm verification.

8.16.2.7 Swinging fire shutters.

Where fire shutters of the swinging type are installed in exterior openings, not less than one row in every three vertical rows shall be arranged to be readily opened from the outside, and shall be identified by distinguishing marks or letters not less than 152 mm (6 inches) high.

8.16.2.8 Rolling fire shutters.

Where fire shutters of the rolling type are installed, such shutters shall include approved automatic-closing devices.

8.16.2.9 Labeled protective assemblies.

Fire door assemblies shall be labeled by an approved agency. The labels shall comply with the Ghana Fire Code, and shall be permanently affixed to the door or frame.

8.16.2.9.1 Fire door labeling requirements.

Fire doors shall be labeled showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or trademark of the third-party inspection agency, the fire protection rating and, where required for fire doors in interior exit stairways and ramps and exit passageways by Clause 8.16.2.2.3, the maximum transmitted temperature end point. Smoke and draft control doors complying with this Code shall be labeled as such and shall comply with Clause 8.16.2.9.3. Labels shall be approved and permanently affixed. The label shall be applied at the factory or location where fabrication and assembly are performed.

8.16.2.9.1.1 Light kits, louvers and components.

Listed light kits and louvers and their required preparations shall be considered as part of the labeled door where such installations are done under the listing program of the third-party agency. Fire doors and fire door assemblies shall be permitted to consist of components, including glazing, vision light kits and hardware that are listed or classified and labeled for such use by different third-party agencies.

8.16.2.9.2 Oversized doors.

Oversized fire doors shall bear an oversized fire door label by an approved agency or shall be provided with a certificate of inspection furnished by an approved testing agency. Where a certificate of inspection is furnished by an approved testing agency, the certificate shall state that the door conforms to the requirements of design, materials and construction, but has not been subjected to the fire test.

8.16.2.9.3 Smoke and draft control door labeling requirements.

Smoke and draft control doors complying with this Code shall be labeled in accordance with Clause 8.16.2.9.1 and shall show the letter “S” on the fire-rating label of the door. This marking shall indicate that the door and frame assembly are in compliance where listed or labeled gasketing is installed.
8.16.2.9.4 Fire door frame labeling requirements.
Fire door frames shall be labeled showing the names of the manufacturer and the third-party inspection agency.

8.16.2.9.5 Labeling.
Fire-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and information required in Table 716.1(1) that shall be issued by an approved agency and shall be permanently identified on the glazing.

8.16.2.9.6 Fire door operator labeling requirements.
Fire door operators for horizontal sliding doors shall be labeled and listed for use with the assembly.

8.16.2.10 Installation of door assemblies in corridors and smoke barriers.
Installation of smoke doors shall be in accordance with the Ghana Fire Code.

8.16.3 Fire window assemblies.
Fire window assemblies required by other clauses of this Code shall comply with the provisions of this clause.

8.16.3.1 Testing requirements.
Fire window assemblies shall be constructed of any material or assembly of component materials that conforms to the test requirements of Clauses 8.16.3.1.1 and 8.16.3.1.2 and the fire protection rating indicated in Table 8.16.1(3).

8.16.3.1.1 Testing under positive pressure.
The Ghana Fire Code shall evaluate fire-protection-rated glazing under positive pressure. Within the first 10 minutes of a test, the pressure in the furnace shall be adjusted so not less than two-thirds of the test specimen is above the neutral pressure plane, and the neutral pressure plane shall be maintained at that height for the balance of the test.

8.16.3.1.2 Nonsymmetrical glazing systems.
Nonsymmetrical fire-protection-rated glazing systems in fire partitions, fire barriers or in exterior walls with a fire separation distance of 10 feet (3048 mm) or less pursuant to Clause 8.5 shall be tested with both faces exposed to the furnace, and the assigned fire protection rating shall be the shortest duration obtained from the two tests conducted in compliance with the Ghana Fire Code.

8.16.3.2 Performance requirements.
Fire window assemblies shall be installed in the assemblies and comply with the fire protection rating specified in Table 8.16.1(3).

8.16.3.2.1 Interior fire window assemblies.
Fire-protection-rated glazing used in fire window assemblies located in fire partitions and fire barriers shall be limited to use in assemblies with a maximum fire-resistance rating of 1 hour in accordance with this clause.

8.16.3.2.1.1 Where 3/4-hour-fire-protection window assemblies permitted.
Fire-protection-rated glazing requiring 45-minute opening protection in accordance with Table 8.16.1(3) shall be limited to fire partitions designed in accordance with Clause 8.8 and fire barriers utilized in the applications set forth in Clauses 8.7.3.6, 8.7.3.7 and 8.7.3.9 where the fire-resistance rating does not exceed 1 hour. Fire-resistance-rated glazing assemblies tested in accordance with ASTM E119 shall not be subject to the limitations of this clause.

8.16.3.2.1.2 Area limitations.
The total area of the glazing in fire-protection-rated window assemblies shall not exceed 25 percent of the area of a common wall with any room.

8.16.3.2.1.3 Where 1/3-hour-fire-protection window assemblies permitted.
Fire-protection-rated glazing shall be permitted in window assemblies tested to the Ghana Fire Code in fire partitions requiring 1/3-hour opening protection in accordance with Table 8.16.1(3).
8.16.3.3 Fire window frames.

Fire window frames installed with a fire window assembly shall meet the fire-protection rating indicated in Table 8.16.1(3).

8.16.3.3.1 Window mullions.

Metal mullions that exceed a nominal height of 12 feet (3658 mm) shall be protected with materials to afford the same fire-resistance rating as required for the wall construction in which the protective is located.

8.16.3.4 Fire-protection-rated glazing.

Glazing in fire window assemblies shall be fire protection rated in accordance with this clause and Table 8.16.1(3). Fire-protection-rated glazing in fire window assemblies shall be tested in accordance with and shall meet the acceptance criteria of the Ghana Fire Code. Openings in nonfire-resistance-rated exterior wall assemblies that require protection in accordance with Clause 8.5.3, 8.5.8, 8.5.8.5 or 8.5.8.6 shall have a fire protection rating of not less than 3/4 hour. Fire-protection-rated glazing in 1/2-hour fire-resistance-rated partitions is permitted to have a 20-minute fire protection rating.

8.16.3.4.1 Glass and glazing.

Glazing in fire window assemblies shall be fire-protection-rated glazing installed in accordance with and complying with the size limitations set forth in the Ghana Fire Code.

8.16.3.5 Labeled protective assemblies.

Glazing in fire window assemblies shall be labeled by an approved agency. The labels shall comply with Clause 8.16.3.5.2.

8.16.3.5.1 Fire window frames.

Fire window frames shall be approved for the intended application.

8.16.3.5.2 Labeling requirements.

Fire-protection-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and information required in Clause 8.16.1.2.2.2 and Table 8.16.1(3) that shall be issued by an approved agency and permanently identified on the glazing.

8.16.3.6 Installation.

Fire window assemblies shall be installed in accordance with the provisions of this clause.

8.16.3.6.1 Closure.

Fire-protection-rated glazing shall be in the fixed position or be automatic-closing and shall be installed in labeled frames.

8.17 DUCTS AND AIR TRANSFER OPENINGS

8.17.1 General.

The provisions of this clause shall govern the protection of duct penetrations and air transfer openings in assemblies required to be protected and duct penetrations in nonfire-resistance-rated floor assemblies.

8.17.1.1 Ducts and air transfer openings.

Ducts transitioning horizontally between shafts shall not require a shaft enclosure provided that the duct penetration into each associated shaft is protected with dampers complying with this clause.

8.17.1.2 Ducts that penetrate fire-resistance-rated assemblies without dampers.

Ducts that penetrate fire-resistance-rated walls and are not required by this clause to have fire dampers shall comply with the requirements of Clauses 8.14.3 through 8.14.4.3. Ducts that penetrate horizontal assemblies not required to be contained within a shaft and not required by this clause to have fire dampers shall comply with the requirements of Clauses 8.14.5 through 8.14.6.2.
8.17.1.2.1 Ducts that penetrate nonfire-resistance-rated assemblies.

The space around a duct penetrating a nonfire-resistance-rated floor assembly shall comply with Clause 8.17.6.3.

8.17.2 Installation.

Fire dampers, smoke dampers, combination fire/smoke dampers and ceiling radiation dampers located within air distribution and smoke control systems shall be installed in accordance with the requirements of this clause, the manufacturer's instructions and the dampers' listing.

8.17.2.1 Smoke control system.

Where the installation of a fire damper will interfere with the operation of a required smoke control system in accordance with Clause 10.9, approved alternative protection shall be utilized. Where mechanical systems including ducts and dampers utilized for normal building ventilation serve as part of the smoke control system, the expected performance of these systems in smoke control mode shall be addressed in the rational analysis required by Clause 10.9.4.

8.17.2.2 Hazardous exhaust ducts.

Fire dampers for hazardous exhaust duct systems shall comply with this Code.

8.17.3 Damper testing, ratings and actuation.

Damper testing, ratings and actuation shall be in accordance with Clauses 8.17.3.1 through 8.17.3.3.

8.17.3.1 Damper testing.

Dampers shall be listed and labeled in accordance with the standards in this clause.

1. Fire dampers shall comply with the requirements of this Code. Only fire dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.

2. Smoke dampers shall comply with the requirements of this Code.

3. Combination fire/smoke dampers shall comply with the requirements of this Code.

4. Ceiling radiation dampers shall comply with the requirements of this Code or shall be tested as part of a fire-resistance-rated floor/ceiling or roof/ceiling assembly in accordance with ASTM E119. Only ceiling radiation dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.

5. Corridor dampers shall comply with requirements of this Code. Corridor dampers shall demonstrate acceptable closure performance when subjected to 150 feet per minute (0.76 mps) velocity across the face of the damper during this Code fire exposure test.

8.17.3.2 Damper rating.

Damper ratings shall be in accordance with Clauses 8.17.3.2.1 through 8.17.3.2.4.

8.17.3.2.1 Fire damper ratings.

Fire dampers shall have the minimum rating specified in Table 8.17.3.2.1.

8.17.3.2.2 Smoke damper ratings.

Smoke damper leakage ratings shall be Class I or II. Elevated temperature ratings shall be not less than 250°F (121°C).

8.17.3.2.3 Combination fire/smoke damper ratings.

Combination fire/smoke dampers shall have the minimum rating specified for fire dampers in Table 717.3.2.1 and shall have the minimum rating specified for smoke dampers in Clause 8.17.3.2.2.

8.17.3.2.4 Corridor damper ratings.

Corridor dampers shall have the following minimum ratings:

1. One hour fire-resistance rating.
2. Class I or II leakage rating as specified in Clause 8.17.3.2.2.

8.17.3.3 Damper actuation.

Damper actuation shall be in accordance with Clauses 8.17.3.3.1 through 8.17.3.3.5 as applicable.

8.17.3.3.1 Fire damper actuation device.

The fire damper actuation device shall meet one of the following requirements:

1. The operating temperature shall be approximately 10°C (50°F) above the normal temperature within the duct system, but not less than 71°C (160°F).
2. The operating temperature shall be not more than 177°C (350°F) where located in a smoke control system complying with Clause 10.9.

8.17.3.3.2 Smoke damper actuation.

The smoke damper shall close upon actuation of a listed smoke detector or detectors installed in accordance with Clause 907.3 and one of the following methods, as applicable:

1. Where a smoke damper is installed within a duct, a smoke detector shall be installed inside the duct or outside the duct with sampling tubes protruding into the duct. The detector or tubes within the duct shall be within 5 feet (1524 mm) of the damper. Air outlets and inlets shall not be located between the detector or tubes and the damper. The detector shall be listed for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate.
2. Where a smoke damper is installed above smoke barrier doors in a smoke barrier, a spot-type detector shall be installed on either side of the smoke barrier door opening. The detector shall be listed for releasing service if used for direct interface with the damper.
3. Where a smoke damper is installed within an air transfer opening in a wall, a spot-type detector shall be installed within 5 feet (1524 mm) horizontally of the damper. The detector shall be listed for releasing service if used for direct interface with the damper.
4. Where a smoke damper is installed in a corridor wall or ceiling, the damper shall be permitted to be controlled by a smoke detection system installed in the corridor.
5. Where a smoke detection system is installed in all areas served by the duct in which the damper will be located, the smoke dampers shall be permitted to be controlled by the smoke detection system.

8.17.3.3.3 Combination fire/smoke damper actuation.

Combination fire/smoke damper actuation shall be in accordance with Clauses 8.17.3.3.1 and 8.17.3.3.2. Combination fire/smoke dampers installed in smoke control system shaft penetrations shall not be activated by local area smoke detection unless it is secondary to the smoke management system controls.
8.17.3.4 Ceiling radiation damper actuation.

The operating temperature of a ceiling radiation damper actuation device shall be 27.8°C (50°F) above the normal temperature within the duct system, but not less than 71°C (160°F).

8.17.3.5 Corridor damper actuation.

Corridor damper actuation shall be in accordance with Clauses 8.17.3.3.1 and 8.17.3.3.2.

8.17.4 Access and identification.

Fire and smoke dampers shall be provided with an approved means of access that is large enough to permit inspection and maintenance of the damper and its operating parts. The access shall not affect the integrity of fire-resistance-rated assemblies. The access openings shall not reduce the fire-resistance rating of the assembly. Access points shall be permanently identified on the exterior by a label having letters not less than 12.7 mm (1/2 inch) in height reading: FIRE/SMOKE DAMPER, SMOKE DAMPER or FIRE DAMPER. Access doors in ducts shall be tight fitting and suitable for the required duct construction.

8.17.5 Where required.

Fire, dampers, smoke dampers, combination fire/smoke dampers, ceiling radiation dampers and corridor dampers shall be provided at the locations prescribed in Clauses 8.17.5.1 through 8.17.5.7 and 8.17.6. Where an assembly is required to have both fire dampers and smoke dampers, combination fire/smoke dampers or a fire damper and a smoke damper shall be provided.

8.17.5.1 Fire walls.

Ducts and air transfer openings permitted in fire walls in accordance with Clause 8.8.11 shall be protected with listed fire dampers installed in accordance with their listing.

8.17.5.1.1 Horizontal exits.

A listed smoke damper designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a fire wall that serves as a horizontal exit.

8.17.5.2 Fire barriers.

Ducts and air transfer openings of fire barriers shall be protected with listed fire dampers installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for interior exit stairways and ramps and exit passageways, except as permitted by Clauses 10.23.5 and 10.24.6, respectively.

Exception: Fire dampers are not required at penetrations of fire barriers where any of the following apply:

1. Penetrations are tested in accordance with ASTM E119 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an approved smoke control system in accordance with Clause 10.9 and where the use of a fire damper would interfere with the operation of a smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure’s HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

8.17.5.2.1 Horizontal exits.

A listed smoke damper designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a fire barrier that serves as a horizontal exit.

8.17.5.3 Shaft enclosures.

Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with listed fire and smoke dampers installed in accordance with their listing.
Exceptions:

1. Fire dampers are not required at penetrations of shafts where any of the following criteria are met:

   1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided that there is a continuous airflow upward to the outside.

   1.2. Penetrations are tested in accordance with ASTM E119 as part of the fire-resistance-rated assembly.

   1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Clause 10.9 and where the fire damper will interfere with the operation of the smoke control system.

   1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.

2. In Group B and R occupancies equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, smoke dampers are not required at penetrations of shafts where all of the following criteria are met:

   2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.0187-inch (0.4712 mm) (No. 26 gage).

   2.2. The subducts extend not less than 559 mm (22 inches) vertically.

   2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Clause 10.9.11, so as to maintain a continuous upward airflow to the outside.

3. Smoke dampers are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.

4. Smoke dampers are not required at penetrations of shafts where ducts are used as part of an approved mechanical smoke control system designed in accordance with Clause 10.9 and where the smoke damper will interfere with the operation of the smoke control system.

5. Fire dampers and combination fire/smoke dampers are not required in kitchen and clothes dryer exhaust systems where dampers are prohibited by this Code.

8.17.5.4 Fire partitions.
Ducts and air transfer openings that penetrate fire partitions shall be protected with listed fire dampers installed in accordance with their listing.

Exceptions: In occupancies other than Group H, fire dampers are not required where any of the following apply:

1. Corridor walls in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 and the duct is protected as a through penetration in accordance with Clause 8.14.

2. Tenant partitions in covered and open mall buildings where the walls are not required by provisions elsewhere in the Code to extend to the underside of the floor or roof sheathing, slab or deck above.

3. The duct system is constructed of approved materials in accordance with this Code and the duct penetrating the wall complies with all of the following requirements:

   3.1. The duct shall not exceed 0.06 m² (100 square inches).

   3.2. The duct shall be constructed of steel not less than 0.55 mm (0.0217 inch) in thickness.

   3.3. The duct shall not have openings that communicate the corridor with adjacent spaces or rooms.

   3.4. The duct shall be installed above a ceiling.

   3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.

   3.6. A minimum 305 mm (12-inch-long) by 1.52 mm (0.060-inch-thick) steel sleeve shall be centered in each
duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum 38 mm by 38 mm by 1.52 mm (1 1/2-inch by 1 1/2-inch by 0.060-inch) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The annular space between the steel sleeve and the wall opening shall be filled with mineral wool batting on all sides.

4. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, and are in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure’s HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

8.17.5.4.1 Corridors.
Duct and air transfer openings that penetrate corridors shall be protected with dampers as follows:

1. A corridor damper shall be provided where corridor ceilings, constructed as required for the corridor walls as permitted in Clause 8.8.4, Exception 3, are penetrated.

2. A ceiling radiation damper shall be provided where the ceiling membrane of a fire-resistance-rated floor-ceiling or roof-ceiling assembly, constructed as permitted in Clause 8.8.4, Exception 2, is penetrated.

3. A listed smoke damper designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a corridor enclosure required to have smoke and draft control doors in accordance with Clause 8.16.2.2.1.

Exceptions:

1. Smoke dampers are not required where the building is equipped throughout with an approved smoke control system in accordance with Clause 10.9, and smoke dampers are not necessary for the operation and control of the system.

2. Smoke dampers are not required in corridor penetrations where the duct is constructed of steel not less than 0.019 inch (0.48 mm) in thickness and there are no openings serving the corridor.

8.17.5.5 Smoke barriers.
A listed smoke damper designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a smoke barrier. Smoke dampers and smoke damper actuation methods shall comply with Clause 8.17.3.3.2.

Exceptions:

1. Smoke dampers are not required where the openings in ducts are limited to a single smoke compartment and the ducts are constructed of steel.

2. Smoke dampers are not required in smoke barriers required by Clause 4.7.5 for Group I-2, Condition 2—where the HVAC system is fully ducted in accordance with Clause 7.3 of the International Mechanical Code and where buildings are equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 and equipped with quick-response sprinklers in accordance with Clause 10.3.3.2.

8.17.5.6 Exterior walls.
Ducts and air transfer openings in fire-resistance-rated exterior walls required to have protected openings in accordance with Clause 8.5.10 shall be protected with listed fire dampers installed in accordance with their listing.

8.17.5.7 Smoke partitions.
A listed smoke damper designed to resist the passage of smoke shall be provided at each
point that an air transfer opening penetrates a smoke partition. Smoke dampers and smoke damper actuation methods shall comply with Clause 8.17.3.3.2.

**Exception:** Where the installation of a smoke damper will interfere with the operation of a required smoke control system in accordance with Clause 10.9, approved alternative protection shall be utilized.

### 8.17.6 Horizontal assemblies.

Penetrations by ducts and air transfer openings of a floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly shall be protected by a shaft enclosure that complies with Clause 8.13 or shall comply with Clauses 8.17.6.1 through 8.17.6.3.

#### 8.17.6.1 Through penetrations.

In occupancies other than Groups I-2 and I-3, a duct constructed of approved materials in accordance with the International Mechanical Code that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two stories is permitted without shaft enclosure protection, provided that a listed fire damper is installed at the floor line or the duct is protected in accordance with Clause 8.14.5. For air transfer openings, see Clause 8.12.1.9.

**Exception:** A duct is permitted to penetrate three floors or less without a fire damper at each floor, provided that such duct meets all of the following requirements:

1. The duct shall be contained and located within the cavity of a wall and shall be constructed of steel having a minimum wall thickness of 0.4712 mm (0.0187 inches) (No. 26 gage).
2. The duct shall open into only one dwelling or sleeping unit and the duct system shall be continuous from the unit to the exterior of the building.
3. The duct shall not exceed 102 mm (4-inch) nominal diameter and the total area of such ducts shall not exceed 0.065 m² (100 square inches) in any 9.3 m² (100 square feet) of floor area.
4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature conditions under a minimum positive pressure differential of 2.49 Pa (0.01 inch) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.

5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with a listed ceiling radiation damper installed in accordance with Clause 8.17.6.2.1.

#### 8.17.6.2 Membrane penetrations.

Ducts and air transfer openings constructed of approved materials in accordance with the International Mechanical Code that penetrate the ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with one of the following:

1. A shaft enclosure in accordance with Clause 8.13.
2. A listed ceiling radiation damper installed at the ceiling line where a duct penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.

**Exceptions:**

1. A fire-resistance-rated assembly tested in accordance with ASTM E119 showing that ceiling radiation dampers are not required in order to maintain the fire-resistance rating of the assembly.
2. Where exhaust duct or outdoor air duct penetrations protected in accordance with Clause 8.14.5.2 are located within the cavity of a wall and do not pass through another dwelling unit or tenant space.
3. Where duct and air transfer openings are protected with a duct outlet penetration system tested as part of a fire-resistance-rated assembly in accordance with ASTM E119.
4. A listed ceiling radiation damper installed at the ceiling line where a diffuser with no duct attached penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.
Exceptions:

1. A fire-resistance-rated assembly tested in accordance with ASTM E119 showing that ceiling radiation dampers are not required in order to maintain the fire-resistance rating of the assembly.

2. Where duct and air transfer openings are protected with a duct outlet penetration system tested as part of a fire-resistance-rated assembly in accordance with ASTM E119.

8.17.6.2.1 Ceiling radiation dampers testing and installation.

Ceiling radiation dampers shall be tested in accordance with Clause 8.17.3.1. Ceiling radiation dampers shall be installed in accordance with the details listed in the fire-resistance-rated assembly and the manufacturer's instructions and the listing.

8.17.6.3 Nonfire-resistance-rated floor assemblies.

Duct systems constructed of approved materials in accordance with the International Mechanical Code that penetrate nonfire-resistance-rated floor assemblies shall be protected by any of the following methods:

1. A shaft enclosure in accordance with Clause 8.13.

2. The duct connects not more than two stories, and the annular space around the penetrating duct is protected with an approved noncombustible material that resists the free passage of flame and the products of combustion.

3. In floor assemblies composed of noncombustible materials, a shaft shall not be required where the duct connects not more than three stories, the annular space around the penetrating duct is protected with an approved noncombustible material that resists the free passage of flame and the products of combustion and a fire damper is installed at each floor line.

Exception: Fire dampers are not required in ducts within individual residential dwelling units.

8.17.7 Flexible ducts and air connectors.

Flexible ducts and air connectors shall not pass through any fire-resistance-rated assembly. Flexible air connectors shall not pass through any wall, floor or ceiling.

8.18 CONCEALED SPACES

8.18.1 General.

Fireblocking and draftstopping shall be installed in combustible concealed locations in accordance with this clause. Fireblocking shall comply with Clause 8.18.2. Draftstopping in floor/ceiling spaces and attic spaces shall comply with Clauses 8.18.3 and 8.18.4, respectively. The permitted use of combustible materials in concealed spaces of buildings of Type I or II construction shall be limited to the applications indicated in Clause 718.5.

8.18.2 Fireblocking.

In combustible construction, fireblocking shall be installed to cut off concealed draft openings (both vertical and horizontal) and shall form an effective barrier between floors, between a top storey and a roof or attic space. Fireblocking shall be installed in the locations specified in Clauses 8.18.2.2 through 8.18.2.7.

8.18.2.1 Fireblocking materials.

Fireblocking shall consist of the following materials:

1. Two-inch (51 mm) nominal timber.

2. Two thicknesses of 25 mm (1-inch) nominal timber with broken lap joints.

3. One thickness of 18.3 mm (0.719-inch) wood structural panels with joints backed by 18.3 mm (0.719-inch) wood structural panels.

4. One thickness of 19.1 mm (0.75-inch) particleboard with joints backed by 19 mm (0.75-inch) particleboard.

5. 12.7 mm (One-half-inch) gypsum board.
6. 6.4 mm (One-fourth-inch) cement-based millboard.

7. Batt or blankets of mineral wool, mineral fiber or other approved materials installed in such a manner as to be securely retained in place.

8. Cellulose insulation installed as tested for the specific application.

8.18.2.1 Batts or blankets of mineral wool or mineral fiber.

Batts or blankets of mineral wool or mineral fiber or other approved nonrigid materials shall be permitted for compliance with the 10-foot (3048 mm) horizontal fireblocking in walls constructed using parallel rows of studs or staggered studs.

8.18.2.1.2 Unfaced fiberglass.

Unfaced fiberglass batt insulation used as fireblocking shall fill the entire cross clause of the wall cavity to a minimum height of 406 mm (16 inches) measured vertically. Where piping, conduit or similar obstructions are encountered, the insulation shall be packed tightly around the obstruction.

8.18.2.1.3 Loose-fill insulation material.

Loose-fill insulation material, insulating foam sealants and caulk materials shall not be used as a fireblock unless specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases.

8.18.2.1.4 Fireblocking integrity.

The integrity of fireblocks shall be maintained.

8.18.2.1.5 Double stud walls.

Batts or blankets of mineral or glass fiber or other approved nonrigid materials shall be allowed as fireblocking in walls constructed using parallel rows of studs or staggered studs.

8.18.2.2 Concealed wall spaces.

Fireblocking shall be provided in concealed spaces of stud walls and partitions, including furred spaces, and parallel rows of studs or staggered studs, as follows:

1. Vertically at the ceiling and floor levels.
2. Horizontally at intervals not exceeding 10 feet (3048 mm).

8.18.2.3 Connections between horizontal and vertical spaces.

Fireblocking shall be provided at interconnections between concealed vertical stud wall or partition spaces and concealed horizontal spaces created by an assembly of floor joists or trusses, and between concealed vertical and horizontal spaces such as occur at soffits, drop ceilings, cove ceilings and similar locations.

8.18.2.4 Stairways.

Fireblocking shall be provided in concealed spaces between stair stringers at the top and bottom of the run. Enclosed spaces under stairways shall comply with Clause 11.11.7.3.

8.18.2.5 Ceiling and floor openings.

Where required by Clause 8.12.1.8, Exception 1 of Clause 8.14.5.1.2 or Clause 8.14.6, fireblocking of the annular space around vents, pipes, ducts, chimneys and fireplaces at ceilings and floor levels shall be installed with a material specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and resist the free passage of flame and the products of combustion.

8.18.2.5.1 Factory-built chimneys and fireplaces.

Factory-built chimneys and fireplaces shall be fireblocked in accordance with this Code.

8.18.2.6 Exterior wall coverings.

Fireblocking shall be installed within concealed spaces of exterior wall coverings and other exterior architectural elements where permitted to be of combustible construction as specified in this Code or where erected with combustible frames. Fireblocking shall be installed at maximum intervals of 6096 mm (20 feet) in either dimension so that there will be no
concealed space exceeding $9.3 \text{ m}^2$ (100 square feet) between fireblocking. Where wood furring strips are used, they shall be of approved wood of natural decay resistance or preservative-treated wood. If noncontinuous, such elements shall have closed ends, with not less than 102 mm (4 inches) of separation between clauses.

Exceptions:

1. Fireblocking of cornices is not required in single-family dwellings. Fireblocking of cornices of a two-family dwelling is required only at the line of dwelling unit separation.

2. Fireblocking shall not be required where the exterior wall covering is installed on noncombustible framing and the face of the exterior wall covering exposed to the concealed space is covered by one of the following materials:

   2.1. Aluminum having a minimum thickness of 0.5 mm (0.019 inch).

   2.2. Corrosion-resistant steel having a base metal thickness not less than 0.4 mm (0.016 inch) at any point.

   2.3. Other approved noncombustible materials.

3. Fireblocking shall not be required where the exterior wall covering has been tested in accordance with, and complies with the acceptance criteria of, the Ghana Fire Code. The exterior wall covering shall be installed as tested in accordance with the Ghana Fire Code.

8.18.2.7 Concealed sleeper spaces.

Where wood sleepers are used for laying wood flooring on masonry or concrete fire-resistance-rated floors, the space between the floor slab and the underside of the wood flooring shall be filled with an approved material to resist the free passage of flame and products of combustion or fireblocked in such a manner that open spaces under the flooring shall not exceed $9.3 \text{ m}^2$ (100 square feet) in area and such space shall be filled solidly under permanent partitions so that communication under the flooring between adjoining rooms shall not occur.

Exceptions:

1. Fireblocking is not required for slab-on-grade floors in gymnasiums.

2. Fireblocking is required only at the juncture of each alternate lane and at the ends of each lane in a bowling facility.

8.18.3 Draftstopping in floors.

Draftstopping shall be installed to subdivide floor/ceiling assemblies where required by Clause 8.8.4.2. In other than Group R occupancies, draftstopping shall be installed to subdivide combustible floor/ceiling assemblies so that horizontal floor areas do not exceed 93 m$^2$ (1,000 square feet).

Exception: Buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

8.18.3.1 Draftstopping materials.

Draftstopping materials shall be not less than 12.7 mm (1/2-inch) gypsum board, 3/8-inch (9.5 mm) wood structural panel, 9.5 mm (3/8-inch) particleboard, 25-mm (1-inch) nominal timber, cement fiberboard, batts or blankets of mineral wool or glass fiber, or other approved materials adequately supported. The integrity of draftstops shall be maintained.

8.18.4 Draftstopping in attics.

Draftstopping shall be installed to subdivide attic spaces where required by Clause 8.8.4.2. In other than Group R, draftstopping shall be installed to subdivide combustible attic spaces and combustible concealed roof spaces such that any horizontal area does not exceed 279 m$^2$ (3,000 square feet). Ventilation of concealed roof spaces shall be maintained in accordance with this Code.

Exception: Buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

8.18.4.1 Draftstopping materials.

Materials utilized for draftstopping of attic spaces shall comply with Clause 8.18.3.1.
8.18.4.1.1 Openings.

Openings in the partitions shall be protected by self-closing doors with automatic latches constructed as required for the partitions.

8.18.5 Combustible materials in concealed spaces in Type I or II construction.

Combustible materials shall not be permitted in concealed spaces of buildings of Type I or II construction.

Exceptions:

1. Combustible materials in accordance with Clause 7.33.
2. Combustible materials exposed within plenums complying with Clause 7.2 of the International Mechanical Code.
3. Class A interior finish materials classified in accordance with Clause 9.3.
4. Combustible piping within partitions or shaft enclosures installed in accordance with the provisions of this Code.
5. Combustible piping within concealed ceiling spaces installed in accordance with this Code.
6. Combustible insulation and covering on pipe and tubing, installed in concealed spaces other than plenums, complying with Clause 8.20.7.

8.19 FIRE-RESISTANCE REQUIREMENTS FOR PLASTER

8.19.1 Thickness of plaster.

The minimum thickness of gypsum plaster or Portland cement plaster used in a fire-resistance-rated system shall be determined by the prescribed fire tests. The plaster thickness shall be measured from the face of the lath where applied to gypsum lath or metal lath.

8.19.2 Plaster equivalents.

For fire-resistance purposes, 12.7 mm (1/2 inch) of unsanded gypsum plaster shall be deemed equivalent to 19.1 mm (3/4 inch) of 25 mm (one-to-three gypsum sand plaster or 1 inch) of Portland cement sand plaster.

8.19.3 Noncombustible furring.

In buildings of Type I and II construction, plaster shall be applied directly on concrete or masonry or on approved noncombustible plastering base and furring.

8.19.4 Double reinforcement.

Plaster protection more than 25 mm (1 inch) in thickness shall be reinforced with an additional layer of approved lath embedded not less than 19.1 mm (3/4 inch) from the outer surface and fixed securely in place.

Exception: Solid plaster partitions or where otherwise determined by fire tests.

8.19.5 Plaster alternatives for concrete.

In reinforced concrete construction, gypsum plaster or Portland cement plaster is permitted to be substituted for 12.7 mm (1/2 inch) of the required poured concrete protection, except that a minimum thickness of 3/8 inch (9.5 mm) of poured concrete shall be provided in reinforced concrete floors and 25 mm (1 inch) in reinforced concrete columns in addition to the plaster finish. The concrete base shall be prepared in accordance with Clause 26.10.7.

8.20 THERMAL- AND SOUND-INSULATING MATERIALS

8.20.1 General.

Insulating materials shall comply with the requirements of this clause. Where a flame spread index or a smoke-developed index is specified in this clause, such index shall be
determined in accordance with ASTM E84. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted. Insulating materials, when tested in accordance with the requirements of this clause, shall include facings, when used, such as vapour retarders, vapour permeable membranes and similar coverings, and all layers of single and multilayer reflective foil insulation and similar materials.

Exceptions:

1. Fiberboard insulation shall comply with Part 24.
2. Foam plastic insulation shall comply with Part 27.
3. Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the International Mechanical Code.
4. All layers of single and multilayer reflective plastic core insulation shall comply with Clause 27.14.

8.20.2 Concealed installation.

Insulating materials, where concealed as installed in buildings of any type of construction, shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450. Exception: Cellulosic fiber loose-fill insulation complying with the requirements of Clause 8.20.6 shall not be required to meet a flame spread index requirement but shall be required to meet a smoke-developed index of not more than 450 when tested in accordance with this Code.

8.20.3 Exposed installation.

Insulating materials, where exposed as installed in buildings of any type of construction, shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450. Exception: Cellulosic fiber loose-fill insulation complying with the requirements of Clause 8.20.6 shall not be required to meet a flame spread index requirement but shall be required to meet a smoke-developed index of not more than 450 when tested in accordance with this Code.

8.20.4 Loose-fill insulation.

Loose-fill insulation materials that cannot be mounted in the ASTM E84 apparatus without a screen or artificial supports shall comply with the flame spread and smoke-developed limits of Clauses 8.20.2 and 8.20.3 when tested in accordance with this Code. Exception: Cellulosic fiber loose-fill insulation shall not be required to meet a flame spread index requirement when tested in accordance with this Code, provided that such insulation has a smoke-developed index of not more than 450 and complies with the requirements of Clause 8.20.6.

8.20.5 Roof insulation.

The use of combustible roof insulation not complying with Clauses 8.20.2 and 8.20.3 shall be permitted in any type of construction provided that insulation is covered with approved roof coverings directly applied thereto.

8.20.6 Cellulosic fiber loose-fill insulation and self-supported spray-applied cellulosic insulation.

Cellulosic fiber loose-fill insulation and self-supported spray-applied cellulosic insulation shall comply with this Code. Each package of
such insulating material shall be clearly labeled in accordance with this Code.

8.20.7 Insulation and covering on pipe and tubing.
Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450.

Exception: Insulation and covering on pipe and tubing installed in plenums shall comply with this Code.

8.21 PRESCRIPTIVE FIRE RESISTANCE

8.21.1 General.
The provisions of this clause contain prescriptive details of fire-resistance-rated building elements, components or assemblies. The materials of construction listed in Tables 8.21.1(1), 8.21.1(2) and 8.21.1(3) shall be assumed to have the fire-resistance ratings prescribed therein. Where materials that change the capacity for heat dissipation are incorporated into a fire-resistance-rated assembly, fire test results or other substantiating data shall be made available to the building official to show that the required fire-resistance-rating time period is not reduced.

Joints to be covered with tape and joint compound. Exterior covered with 7/8" wood structural panels, applied vertically with edges over framing or blocking and fastened with 6d common nails (bright) at 12" on center in the field and 6" on center on panel edges. R-19 mineral fiber insulation installed in stud cavity. Rating established from the gypsum-covered side only. | — | — | 6½ | — |

**Note:** For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm², 1 cubic foot = 0.0283 m³.

a. Staples with equivalent holding power and penetration shall be permitted to be used as alternate fasteners to nails for attachment to wood framing.

b. Thickness shown for brick and clay tile is nominal thicknesses unless plastered, in which case thicknesses are net. Thickness shown for concrete masonry and clay masonry is equivalent thickness defined in Clause 8.22.3.1 for concrete masonry and Clause 8.22.4.1.1 for clay masonry. Where all cells are solid grouted or filled with silicone-treated perlite loose-fill insulation; vermiculite loose-fill insulation; or expanded clay, shale or slate lightweight aggregate, the equivalent thickness shall be the thickness of the block or brick using specified dimensions as defined in Part 22. Equivalent thickness shall include the thickness of applied plaster and lath or gypsum wallboard, where specified.

c. For units in which the net cross-clausal area of cored brick in any plane parallel to the surface containing the cores is not less than 75 percent of the gross cross-clausal area measured in the same plane.

d. Shall be used for nonbearing purposes only.

e. For all of the construction with gypsum wallboard described in this table, gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided that attachment is identical to that specified for the wallboard, and the joints on the face layer are reinforced and the entire surface is covered with not less than 1/16-inch gypsum veneer plaster.

f. The fire-resistance time period for concrete masonry units meeting the equivalent thicknesses required for a 2-hour fire-resistance rating in Item 3, and having a thickness of not less than 75/8 inches is 4 hours where cores that are not grouted are filled with silicone-treated perlite loose-fill insulation; vermiculite loose-fill insulation; or expanded clay, shale or slate lightweight aggregate, sand or slag having a maximum particle size of 3/8 inch.

g. The fire-resistance rating of concrete masonry units composed of a combination of aggregate types or where plaster is applied directly to the concrete masonry shall be determined in accordance with this Code. Lightweight aggregates shall have a maximum combined density of 65 pounds per cubic foot.
h. See Note b. The equivalent thickness shall be permitted to include the thickness of cement plaster or 1.5 times the thickness of gypsum plaster applied in accordance with the requirements of Part 26.

i. Concrete walls shall be reinforced with horizontal and vertical temperature reinforcement as required by Part 20.

j. Studs are welded truss wire studs with 0.18 inch (No. 7 B.W. gage) flange wire and 0.18 inch (No. 7 B.W. gage) truss wires.

k. Nailable metal studs consist of two channel studs spot welded back to back with a crimped web forming a nailing groove.

l. Wood structural panels shall be permitted to be installed between the fire protection and the wood studs on either the interior or exterior side of the wood frame assemblies in this table, provided that the length of the fasteners used to attach the fire protection is increased by an amount not less than the thickness of the wood structural panel.

m. For studs with a slenderness ratio, \( l_e/d \), greater than 33, the design stress shall be reduced to 78 percent of allowable \( F_c' \). For studs with a slenderness ratio, \( l_e/d \), not exceeding 33, the design stress shall be reduced to 78 percent of the adjusted stress \( F_c' \) calculated for studs having a slenderness ratio \( l_e/d \) of 33.

n. For properties of cooler or wallboard nails, see ASTM C514, ASTM C547 or ASTM F1667.

o. Generic fire-resistance ratings (those not designated as PROPRIETARY* in the listing) in the GA 600 shall be accepted as if herein listed.

p. NCMA TEK 5-8A shall be permitted for the design of fire walls.

q. The design stress of studs shall be equal to not more than 100 percent of the allowable \( F_c \) calculated in accordance with this Code.

</table>

Note: For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m³, 1 pound per square inch = 6.895 kPa, 1 pound per linear foot = 1.4882 kg/m.

1. Staples with equivalent holding power and penetration shall be permitted to be used as alternate fasteners to nails for attachment to wood framing.
b. Where the slab is in an unrestrained condition, minimum reinforcement cover shall be not less than 15/8 inches for 4 hours (siliceous aggregate only); 11/4 inches for 3 hours; 1 inch for 2 hours (siliceous aggregate only); and 3/4 inch for all other restrained and unrestrained conditions.

c. For all of the construction with gypsum wallboard described in this table, gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided that attachment is identical to that specified for the wallboard, and the joints on the face layer are reinforced and the entire surface is covered with not less than 1/16-inch gypsum veneer plaster.

d. Slab thickness over steel joists measured at the joists for metal lath form and at the top of the form for steel form units.

e. (a) The maximum allowable stress level for H-Series joists shall not exceed 22,000 psi.

(b) The allowable stress for K-Series joists shall not exceed 26,000 psi, the nominal depth of such joist shall be not less than 10 inches and the nominal joist weight shall be not less than 5 pounds per linear foot.

f. Cement plaster with 15 pounds of hydrated lime and 3 pounds of approved additives or admixtures per bag of cement.

g. Gypsum wallboard ceilings attached to steel framing shall be permitted to be suspended with 11/2-inch cold-formed carrying channels spaced 48 inches on center, that are suspended with No. 8 SWG galvanized wire hangers spaced 48 inches on center. Cross-furring channels are tied to the carrying channels with No. 18 SWG galvanized wire hangers spaced 48 inches on center. Cross-furring channels are tied to the carrying channels with No. 18 SWG galvanized wire (double strand) and spaced as required for direct attachment to the framing. This alternative is applicable to those steel framing assemblies recognized under Note q.

h. Six-inch hollow clay tile with 2-inch concrete slab above.

i. Four-inch hollow clay tile with 11/2-inch concrete slab above.

j. Thickness measured to bottom of steel form units.

k. Five-eighths inch of vermiculite gypsum plaster plus 1/2 inch of approved vermiculite acoustical plastic.

l. Furring channels spaced 12 inches on center.

m. Double wood floor shall be permitted to be either of the following:

(a) Subfloor of 1-inch nominal boarding, a layer of asbestos paper weighing not less than 14 pounds per 100 square feet and a layer of 1-inch nominal tongue-and-groove finished flooring.

(b) Subfloor of 1-inch nominal tongue-and-groove boarding or 15/32-inch wood structural panels with exterior glue and a layer of 1-inch nominal tongue-and-groove finished flooring or 19/32-inch wood structural panel finish flooring or a layer of Type I Grade M-1 particleboard not less than 5/8-inch thick.

n. The ceiling shall be permitted to be omitted over unusable space, and flooring shall be permitted to be omitted where unusable space occurs above.

o. For properties of cooler or wallboard nails, see ASTM C514, ASTM C547 or ASTM F1667.

p. Thickness measured on top of steel deck unit.

q. Generic fire-resistance ratings (those not designated as PROPRIETARY™ in the listing) in the GA 600 shall be accepted as if herein listed.

8.21.1.1 Thickness of protective coverings.

The thickness of fire-resistant materials required for protection of structural members shall be not less than set forth in Table 8.21.1(1), except as modified in this clause. The figures shown shall be the net thickness of the protecting materials and shall not include any hollow space in back of the protection.

8.21.1.2 Unit masonry protection.

Where required, metal ties shall be embedded in bed joints of unit masonry for protection of steel columns. Such ties shall be as set forth in Table 8.21.1(1) or be equivalent thereto.

8.21.1.3 Reinforcement for cast-in-place concrete column protection.

Cast-in-place concrete protection for steel columns shall be reinforced at the edges of such members with wire ties of not less than 4.6 mm (0.18 inch) in diameter wound spirally around the columns on a pitch of not more than 203 mm (8 inches) or by equivalent reinforcement.

8.21.1.4 Plaster application.
The finish coat is not required for plaster protective coatings where those coatings comply with the design mix and thickness requirements of Tables 8.21.1(1), 8.21.1(2) and 8.21.1(3).

8.21.1.5 Bonded prestressed concrete tendons.

For members having a single tendon or more than one tendon installed with equal concrete cover measured from the nearest surface, the cover shall be not less than that set forth in Table 8.21.1(1). For members having multiple tendons installed with variable concrete cover, the average tendon cover shall be not less than that set forth in Table 8.21.1(1), provided that:

1. The clearance from each tendon to the nearest exposed surface is used to determine the average cover.

2. The clear cover for individual tendons shall not be less than one-half of that set forth in Table 8.21.1(1). A minimum cover of 19.1 mm (3/4 inch) for slabs and 25 mm (1 inch) for beams is required for any aggregate concrete

3. For the purpose of establishing a fire-resistance rating, tendons having a clear covering less than that set forth in Table 8.21.1(1) shall not contribute more than 50 percent of the required ultimate moment capacity for members less than 0.226 m² (350 square inches) in cross-clausal area and 65 percent for larger members. For structural design purposes, however, tendons having a reduced cover are assumed to be fully effective.

8.22 CALculated fire resistance

8.22.1 General.

The provisions of this clause contain procedures by which the fire resistance of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this clause and shall not be otherwise used. The calculated fire resistance of concrete, concrete masonry and clay masonry assemblies shall be permitted in accordance with this Code. The calculated fire resistance of steel assemblies shall be permitted in accordance with Part 5 of ASCE 29. The calculated fire resistance of exposed wood members and wood decking shall be permitted in accordance with this Code.

8.22.2 Concrete assemblies.

The provisions of this clause contain procedures by which the fire-resistance ratings of concrete assemblies are established by calculations.

8.22.2.1 Concrete walls.

Cast-in-place and precast concrete walls shall comply with Clause 8.22.2.1.1. Multiwythe concrete walls shall comply with Clause 8.22.2.1.2. Joints between precast panels shall comply with Clause 8.22.2.1.3. Concrete walls with gypsum wallboard or plaster finish shall comply with Clause 8.22.2.1.4.

8.22.2.1.1 Cast-in-place or precast walls.

The minimum equivalent thicknesses of cast-in-place or precast concrete walls for fire-resistance ratings of 1 hour to 4 hours are shown in Table 8.22.2.1.1. For solid walls with flat vertical surfaces, the equivalent thickness is the same as the actual thickness. The values in Table 8.22.2.1.1 apply to plain, reinforced or prestressed concrete walls.

<table>
<thead>

</tr>
<tr>
<td>Lightweight</td>
<td>2.5</td>
</tr>
</tbody>
</table>

Note: For SI: 1 inch = 25.4 mm.
8.22.2.1.1 Hollow-core precast wall panels.

For hollow-core precast concrete wall panels in which the cores are of constant cross clause throughout the length, calculation of the equivalent thickness by dividing the net cross-clausal area (the gross cross clause minus the area of the cores) of the panel by its width shall be permitted.

8.22.2.1.2 Core spaces filled.

Where all of the core spaces of hollow-core wall panels are filled with loose-fill material, such as expanded shale, clay or slag, or vermiculite or perlite, the fire-resistance rating of the wall is the same as that of a solid wall of the same concrete type and of the same overall thickness.

8.22.2.1.3 Tapered cross clauses.

The thickness of panels with tapered cross clauses shall be that determined at a distance 2t or 6 inches (152 mm), whichever is less, from the point of minimum thickness, where t is the minimum thickness.

8.22.2.1.4 Ribbed or undulating surfaces.

The equivalent thickness of panels with ribbed or undulating surfaces shall be determined by one of the following expressions:

For \( s \geq 4t \), the thickness to be used shall be \( t \)

For \( s \leq 2t \), the thickness to be used shall be \( t_e \)

For \( 4t > s > 2t \), the thickness to be used shall be

\[
\text{(Equation 8-3)}
\]

where:

\( s \) = Spacing of ribs or undulations.

8.22.2.1.2 Multiwythe walls.

For walls that consist of two wythes of different types of concrete, the fire-resistance ratings shall be permitted to be determined from Figure 8.22.2.1.2.

\[
t = \text{Minimum thickness.}
\]

\[
t_e = \text{Equivalent thickness of the panel calculated as the net cross-clausal area of the panel divided by the width, in which the maximum thickness used in the calculation shall not exceed } 2t.
\]

---

**FIGURE 8.22.2.1.2 FIRE-RESISTANCE RATINGS OF TWO-WYTHE CONCRETE WALLS**

Note: For SI: 1 inch = 25.4 mm, 1 pound per cubic foot = 16.02 kg/m3.

Table 8.22.2.1.2(2).

8.22.2.1.2 Foam plastic insulation.

The fire-resistance ratings of precast concrete wall panels consisting of a layer of foam plastic insulation sandwiched between two wythes of concrete shall be permitted to be determined by use of Equation 8-4. Foam plastic insulation with a total thickness of less than 1 inch (25 mm) shall be disregarded. The Rn value for thickness of foam plastic insulation of 1 inch (25 mm) or greater, for use in the calculation, is 5 minutes; therefore Rn0.59 = 2.5.

8.22.2.1.3 Joints between precast wall panels.

Joints between precast concrete wall panels that are not insulated as required by this clause shall be considered as openings in walls. Uninsulated joints shall be included in determining the percentage of openings permitted by Table 8.5.8. Where openings are not permitted or are required by this Code to be protected, the provisions of this clause shall be used to determine the amount of joint insulation required. Insulated joints shall not be considered openings for purposes of determining compliance with the allowable percentage of openings in Table 8.5.8.

8.22.2.1.3.1 Ceramic fiber joint protection.

Figure 722.2.1.3.1 shows thicknesses of ceramic fiber blankets to be used to insulate joints between precast concrete wall panels for various panel thicknesses and for joint widths of 3/8 inch (9.5 mm) and 1 inch (25 mm) for fire-resistance ratings of 1 hour to 4 hours. For joint widths between 3/8 inch (9.5 mm) and 1 inch (25 mm), the thickness of ceramic fiber blanket is allowed to be determined by direct interpolation. Other tested and labeled materials are acceptable in place of ceramic fiber blankets.
8.22.2.1.4 Walls with gypsum wallboard or plaster finishes.

The fire-resistance rating of cast-in-place or precast concrete walls with finishes of gypsum wallboard or plaster applied to one or both sides shall be permitted to be calculated in accordance with the provisions of this clause.

</tbody>
</table>

**Note:** For SI: 1 inch = 25.4 mm.

**a.** The actual thickness of Portland cement-sand plaster, provided that it is 5/8 inch or less in thickness, shall be permitted to be included in determining the equivalent thickness of the masonry for use in Table 8.22.3.2.

## 8.22.2.1.4.1 Nonfire-exposed side.

Where the finish of gypsum wallboard or plaster is applied to the side of the wall not exposed to fire, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The thickness of the finish shall first be corrected by multiplying the actual thickness of the finish by the applicable factor determined from Table 8.22.2.1.4(1) based on the type of
aggregate in the concrete. The corrected thickness of finish shall then be added to the actual or equivalent thickness of concrete and fire-resistance rating of the concrete and finish determined from Tables 8.22.2.1.1 and 8.22.2.1.2(1) and Figure 8.22.2.1.2.

8.22.2.1.4.2 Fire-exposed side.

Where gypsum wallboard or plaster is applied to the fire-exposed side of the wall, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The time assigned to the finish as established by Table 8.22.2.1.4(2) shall be added to the fire-resistance rating determined from Tables 8.22.2.1.1 and 8.22.2.1.2(1) and Figure 8.22.2.1.2 for the concrete alone, or to the rating determined in Clause 8.22.2.1.4.1 for the concrete and finish on the nonfire-exposed side.

8.22.2.1.4.3 Nonsymmetrical assemblies.

For a wall without finish on one side or having different types or thicknesses of finish on each side, the calculation procedures of Clauses 8.22.2.1.4.1 and 8.22.2.1.4.2 shall be performed twice, assuming either side of the wall to be the fire-exposed side. The fire-resistance rating of the wall shall not exceed the lower of the two values.

Exception: For an exterior wall with a fire separation distance greater than 1524 mm (5 feet) the fire shall be assumed to occur on the interior side only.

8.22.2.1.4.4 Minimum concrete fire-resistance rating.

Where finishes applied to one or both sides of a concrete wall contribute to the fire-resistance rating, the concrete alone shall provide not less than one-half of the total required fire-resistance rating. Additionally, the contribution to the fire resistance of the finish on the nonfire-exposed side of a load-bearing wall shall not exceed one-half the contribution of the concrete alone.

8.22.2.1.4.5 Concrete finishes.

Finishes on concrete walls that are assumed to contribute to the total fire-resistance rating of the wall shall comply with the installation requirements of Clause 8.22.3.2.5.

8.22.2.2 Concrete floor and roof slabs.

Reinforced and prestressed floors and roofs shall comply with Clause 8.22.2.2.1. Multicourse floors and roofs shall comply with Clauses 8.22.2.2.2 and 8.22.2.2.3, respectively.

8.22.2.2.1 Reinforced and prestressed floors and roofs.

The minimum thicknesses of reinforced and prestressed concrete floor or roof slabs for fire-resistance ratings of 1 hour to 4 hours are shown in Table 8.22.2.2.1.

Exception: Minimum thickness shall not be required for floors and ramps within parking garages constructed in accordance with Clauses 4.6.5 and 4.6.6.

### TABLE 8.22.2.2.1

<table>
<thead>
<tr>
<th>CONCRETE TYPE</th>
<th>FIRE-RESISTANCE RATING (hours)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Lightweight</td>
<td>2.5</td>
</tr>
</tbody>
</table>

Note: For SI: 1 inch = 25.4 mm.

8.22.2.2.1.1 Hollow-core prestressed slabs.

For hollow-core prestressed concrete slabs in which the cores are of constant cross clause throughout the length, the equivalent thickness shall be permitted to be obtained by dividing the net cross-clauseal area of the slab including grout in the joints, by its width.

8.22.2.2.1.2 Slabs with sloping soffits.

The thickness of slabs with sloping soffits (see Figure 8.22.2.2.1.2) shall be determined at a distance 2t or 152 mm (6 inches), whichever is less, from the point of minimum thickness, where t is the minimum thickness.
Note: For SI: 1 inch = 25.4 mm

FIGURE 8.22.2.1.3 SLABS WITH RIBBED OR UNDULATING SOFFITS

8.22.2.2.2 Multicourse floors.

The fire-resistance ratings of floors that consist of a base slab of concrete with a topping (overlay) of a different type of concrete shall comply with Figure 8.22.2.2.2.

8.22.2.2.3 Multicourse roofs.

The fire-resistance ratings of roofs that consist of a base slab of concrete with a topping (overlay) of an insulating concrete or with an insulating board and built-up roofing shall comply with Figures 8.22.2.2.3(1) and 8.22.2.2.3(2).

Note: For: 1 inch = 25.4 mm

FIGURE 8.22.2.1.2 DETERMINATION OF SLAB THICKNESS FOR SLOPING SOFFITS

8.22.2.1.3 Slabs with ribbed soffits.

The thickness of slabs with ribbed or undulating soffits (see Figure 8.22.2.1.3) shall be determined by one of the following expressions, whichever is applicable:

For $s > 4t$, the thickness to be used shall be $t$

For $s \leq 2t$, the thickness to be used shall be $t_e$

For $4t > s > 2t$, the thickness to be used shall be

$$t + \left(\frac{4t}{s} - 1\right)(t_e - t)$$

(Equation 8-5)

Where:

$S$ = Spacing of ribs or undulations.

$T$ = Minimum thickness.

$t_e$ = Equivalent thickness of the slab calculated as the net area of the slab divided by the width, in which the maximum thickness used in the calculation shall not exceed $2t$. 

Note: For SI: 1 inch = 25.4 mm

FIGURE 8.22.2.2.1.3 SLABS WITH RIBBED OR UNDULATING SOFFITS
8.22.2.2.3.1 Heat transfer.

For the transfer of heat, three-ply built-up roofing contributes 10 minutes to the fire-resistance rating. The fire-resistance rating for concrete assemblies such as those shown in Figure 8.22.2.2.3(1) shall be increased by 10 minutes. This increase is not applicable to those shown in Figure 8.22.2.2.3(2).

8.22.2.2.4 Joints in precast slabs.

Joints between adjacent precast concrete slabs need not be considered in calculating the slab thickness provided that a concrete topping not less than 25 mm (1 inch) thick is used. Where concrete topping is not used, joints must be grouted to a depth of not less than one-third the slab thickness at the joint, but not less than 25 mm (1 inch), or the joints must be made fire resistant by other approved methods.

8.22.2.3 Concrete cover over reinforcement.

The minimum thickness of concrete cover over reinforcement in concrete slabs, reinforced beams and prestressed beams shall comply with this clause.

Note:

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Tabulated values for restrained assemblies apply to beams spaced more than 4 feet on center. For restrained beams spaced 4 feet or less on center, minimum cover of 3/4 inch is adequate for ratings of 4 hours or less.

b. For beam widths between the tabulated values, the minimum cover thickness can be determined by direct interpolation.

c. The cover for an individual reinforcing bar is the minimum thickness of concrete between the surface of the bar and the fire-exposed surface of the beam. For beams in which several bars are used, the cover for corner bars used in the calculation shall be reduced to one-half of the actual value. The cover for an individual bar must be not less than one-half of the value given in Table 8.22.2.3(3) nor less than 3/4 inch.

</tbody>
</table>

**Note**: For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square inch = 645.2 mm².

a. Tabulated values for restrained assemblies apply to beams spaced more than 4 feet on center. For restrained beams spaced 4 feet or less on center, minimum cover of 3/4 inch is adequate for 4-hour ratings or less.

b. For beam widths between 8 inches and 12 inches, minimum cover thickness can be determined by direct interpolation.

c. Not practical for 8-inch-wide beam but shown for purposes of interpolation.

### 8.22.2.3.1 Slab cover.

The minimum thickness of concrete cover to the positive moment reinforcement shall comply with Table 8.22.2.3(1) for reinforced concrete and Table 8.22.2.3(2) for prestressed concrete. These tables are applicable for solid or hollow-core one-way or two-way slabs with flat undersurfaces. These tables are applicable to slabs that are either cast in place or precast. For precast prestressed concrete not covered elsewhere, the procedures contained in this Code shall be acceptable.

### 8.22.2.3.2 Reinforced beam cover.

The minimum thickness of concrete cover to the positive moment reinforcement (bottom steel) for reinforced concrete beams is shown in Table 8.22.2.3(3) for fire-resistance ratings of 1 hour to 4 hours.

### 8.22.2.3.3 Prestressed beam cover.

The minimum thickness of concrete cover to the positive moment prestressing tendons (bottom steel) for restrained and unrestrained prestressed concrete beams and stemmed units shall comply with the values shown in Tables 8.22.2.3(4) and 8.22.2.3(5) for fire-
resistance ratings of 1 hour to 4 hours. Values in Table 8.22.2.3(4) apply to beams 8 inches (203 mm) or greater in width. Values in Table 8.22.2.3(5) apply to beams or stems of any width, provided that the cross- clause area is not less than 40 square inches (25806 mm²). In case of differences between the values determined from Table 8.22.2.3(4) or 8.22.2.3(5), it is permitted to use the smaller value. The concrete cover shall be calculated in accordance with Clause 8.22.2.3.3.1. The minimum concrete cover for non prestressed reinforcement in prestressed concrete beams shall comply with Clause 8.22.2.3.2.

8.22.2.3.3.1 Calculating concrete cover.

The concrete cover for an individual tendon is the minimum thickness of concrete between the surface of the tendon and the fire-exposed surface of the beam, except that for ungrouted ducts, the assumed cover thickness is the minimum thickness of concrete between the surface of the duct and the fire-exposed surface of the beam. For beams in which two or more tendons are used, the cover is assumed to be the average of the minimum cover of the individual tendons. For corner tendons (tendons equal distance from the bottom and side), the minimum cover used in the calculation shall be one-half the actual value. For stemmed members with two or more prestressing tendons located along the vertical centerline of the stem, the average cover shall be the distance from the bottom of the member to the centroid of the tendons. The actual cover for any individual tendon shall be not less than one-half the smaller value shown in Tables 8.22.2.3(4) and 8.22.2.3(5), or 1 inch (25 mm), whichever is greater.

8.22.2.4 Concrete columns.

Concrete columns shall comply with this clause.

**TABLE 8.22.2.4 MINIMUM DIMENSION OF CONCRETE COLUMNS (inches)**

<table>

<td>8</td>
<td>9</td>
<td>10</td>
<td>11</td>
<td>12</td>
</tr>
</tbody>
</table>

**Note:** For SI: 1 inch = 25 mm.

- a. The minimum dimension is permitted to be reduced to 8 inches for rectangular columns with two parallel sides not less than 36 inches in length.
- b. The minimum dimension is permitted to be reduced to 10 inches for rectangular columns with two parallel sides not less than 36 inches in length.

**8.22.2.4.1 Minimum size.**

The minimum overall dimensions of reinforced concrete columns for fire-resistance ratings of 1 hour to 4 hours for exposure to fire on all sides shall comply with this clause.

8.22.2.4.1.1 Concrete strength less than or equal to 12,000 psi.

For columns made with concrete having a specified compressive strength, $f'_{c}$, of less than or equal to 12,000 psi (82.7 MPa), the minimum dimension shall comply with Table 8.22.2.4.

8.22.2.4.1.2 Concrete strength greater than 12,000 psi.

For columns made with concrete having a specified compressive strength, $f'_{c}$, greater than 12,000 psi (82.7 MPa), for fire-resistance ratings of 1 hour to 4 hours the minimum dimension shall be 610 mm (24 inches).

8.22.2.4.2 Minimum cover for R/C columns.

The minimum thickness of concrete cover to the main longitudinal reinforcement in columns, regardless of the type of aggregate used in the concrete and the specified compressive strength of concrete, $f'_{c}$, shall be not less than 25 mm (1 inch) times the number of hours of required fire resistance or 51 mm (2 inches), whichever is less.

8.22.2.4.3 Tie and spiral reinforcement.

For concrete columns made with concrete having a specified compressive strength, $f'_{c}$, greater than 82.7 MPa (12,000 psi), tie and spiral reinforcement shall comply with the following:

1. The free ends of rectangular ties shall terminate with a 135-degree (2.4 rad) standard tie hook.
2. The free ends of circular ties shall terminate with a 90-degree (1.6 rad) standard tie hook.

3. The free ends of spirals, including at lap splices, shall terminate with a 90-degree (1.6 rad) standard tie hook.

The hook extension at the free end of ties and spirals shall be the larger of six bar diameters and the extension required by this Code. Hooks shall project into the core of the column.

8.22.2.4 Columns built into walls.

The minimum dimensions of Table 8.22.2.4 do not apply to a reinforced concrete column that is built into a concrete or masonry wall provided that all of the following are met:

1. The fire-resistance rating for the wall is equal to or greater than the required rating of the column.
2. The main longitudinal reinforcing in the column has cover not less than that required by Clause 8.22.2.4.2.
3. Openings in the wall are protected in accordance with Clause 8.16.

Where openings in the wall are not protected as required by Clause 8.16, the minimum dimension of columns required to have a fire-resistance rating of 3 hours or less shall be 203 mm (8 inches), and 254 mm (10 inches) for columns required to have a fire-resistance rating of 4 hours, regardless of the type of aggregate used in the concrete.

8.22.2.4.5 Precast cover units for steel columns.

See Clause 8.22.5.1.4.

8.22.3 Concrete masonry.

The provisions of this clause contain procedures by which the fire-resistance ratings of concrete masonry are established by calculations.

8.22.3.1 Equivalent thickness.

The equivalent thickness of concrete masonry construction shall be determined in accordance with the provisions of this clause.

8.22.3.1.1 Concrete masonry unit plus finishes.

The equivalent thickness of concrete masonry assemblies, \( T_{ea} \), shall be computed as the sum of the equivalent thickness of the concrete masonry unit, \( T_e \), as determined by Clause 8.22.3.1.2, 8.22.3.1.3 or 8.22.3.1.4, plus the equivalent thickness of finishes, \( T_{ef} \), determined in accordance with Clause 8.22.3.2:

\[
T_{ea} = T_e + T_{ef} \quad \text{(Equation 8-6)}
\]

8.22.3.1.2 Ungroated or partially grouted construction.

\( T_e \) shall be the value obtained for the concrete masonry unit determined in accordance with ASTM C140.

8.22.3.1.3 Solid grouted construction.

The equivalent thickness, \( T_e \), of solid grouted concrete masonry units is the actual thickness of the unit.

8.22.3.1.4 Airspaces and cells filled with loose-fill material.

The equivalent thickness of completely filled hollow concrete masonry is the actual thickness of the unit where loose-fill materials are: sand, pea gravel, crushed stone, or slag that meet ASTM C33 requirements; pumice, scoria, expanded shale, expanded clay, expanded slate, expanded slag, expanded fly ash, or cinders that comply with ASTM C331; or perlite or vermiculite meeting the requirements of ASTM C549 and ASTM C516, respectively.

8.22.3.2 Concrete masonry walls.

The fire-resistance rating of walls and partitions constructed of concrete masonry units shall be determined from Table 8.22.3.2. The rating shall be based on the equivalent thickness of the masonry and type of aggregate used.
TABLE 8.22.3.2 MINIMUM EQUIVALENT THICKNESS (inches) OF BEARING OR NONBEARING CONCRETE MASONRY WALLS\textsuperscript{a, b, c, d}

<table>
<thead>

</tr>
<tr>
<td>Limestone, cinders or unexpanded slag</td>
<td>1.9</td>
</tr>
<tr>
<td>Calcareous or siliceous gravel</td>
<td>2.0</td>
</tr>
</tbody>
</table>

Note: For SI: $1$ inch $= 25.4$ mm.
\textsuperscript{a} Values between those shown in the table can be determined by direct interpolation.
\textsuperscript{b} Where combustible members are framed into the wall, the thickness of solid material between the end of each member and the opposite face of the wall, or between members set in from opposite sides, shall be not less than 93 percent of the thickness shown in the table.
\textsuperscript{c} Requirements of ASTM C55, ASTM C73, ASTM C90 or ASTM C744 shall apply.
\textsuperscript{d} Minimum required equivalent thickness corresponding to the hourly fire-resistance rating for units with a combination of aggregate shall be determined by linear interpolation based on the percent by volume of each aggregate used in manufacture.

8.22.3.2.1 Finish on nonfire-exposed side.

Where plaster or gypsum wallboard is applied to the side of the wall not exposed to fire, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The thickness of gypsum wallboard or plaster shall be corrected by multiplying the actual thickness of the finish by applicable factor determined from Table 8.22.2.1.4(1). This corrected thickness of finish shall be added to the equivalent thickness of masonry and the fire-resistance rating of the masonry and finish determined from Table 8.22.3.2.

8.22.3.2.2 Finish on fire-exposed side.

Where plaster or gypsum wallboard is applied to the fire-exposed side of the wall, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The time assigned to the finish as established by Table 8.22.2.1.4(2) shall be added to the fire-resistance rating determined in Clause 8.22.3.2 for the masonry alone, or in Clause 8.22.3.2.1 for the masonry and finish on the nonfire-exposed side.

8.22.3.2.3 Nonsymmetrical assemblies.

For a wall without finish on one side or having different types or thicknesses of finish on each side, the calculation procedures of this clause shall be performed twice, assuming either side of the wall to be the fire-exposed side. The fire-resistance rating of the wall shall not exceed the lower of the two values calculated.

Exception: For exterior walls with a fire separation distance greater than 1524 mm (5 feet), the fire shall be assumed to occur on the interior side only.

8.22.3.2.4 Minimum concrete masonry fire-resistance rating.

Where the finish applied to a concrete masonry wall contributes to its fire-resistance rating, the masonry alone shall provide not less than one-half the total required fire-resistance rating.

8.22.3.2.5 Attachment of finishes.

Installation of finishes shall be as follows:

1. Gypsum wallboard and gypsum lath applied to concrete masonry or concrete walls shall be secured to wood or steel furring members spaced not more than 406 mm (16 inches) on center (o.c.).
2. Gypsum wallboard shall be installed with the long dimension parallel to the furring members and shall have all joints finished.

3. Other aspects of the installation of finishes shall comply with the applicable provisions of Parts 8 and 26.

8.22.3.3 Multiwythe masonry walls.

The fire-resistance rating of wall assemblies constructed of multiple wythes of masonry materials shall be permitted to be based on the fire-resistance rating period of each wythe and the continuous airspace between each wythe in accordance with the following formula:

\[ R_A = (R_1^{0.60} + R_2^{0.60} + \ldots + R_n^{0.60} + A_1 + A_2 + \ldots + A_n)^{1.7} \]

Where:
- \( R_A \) = Fire-resistance rating of the assembly (hours).
- \( R_1, R_2, \ldots, R_n \) = Fire-resistance rating of wythes for 1, 2, n (hours), respectively.
- \( A_1, A_2, \ldots, A_n \) = 0.30, factor for each continuous airspace for 1, 2, ..,n, respectively, having a depth of 1/2 inch (12.7 mm) or more between wythes.

8.22.3.4 Concrete masonry lintels.

Fire-resistance ratings for concrete masonry lintels shall be determined based on the nominal thickness of the lintel and the minimum thickness of concrete masonry or concrete, or any combination thereof, covering the main reinforcing bars, as determined in accordance with Table 8.22.3.4, or by approved alternate methods.

Note: For SI: 1 inch = 25.4 mm.

8.22.4 Clay brick and tile masonry.

The provisions of this clause contain procedures by which the fire-resistance ratings of clay brick and tile masonry are established by calculations.

8.22.4.1 Masonry walls.

The fire-resistance rating of masonry walls shall be based on the equivalent thickness as calculated in accordance with this clause. The calculation shall take into account finishes applied to the wall and airspaces between wythes in multiwythe construction.

**TABLE 8.22.4.1(1) FIRE-RESISTANCE PERIODS OF CLAY MASONRY WALLS**

722.4.1.1.3

**Note:** For SI: 1 inch = 25.4 mm.

a. Equivalent thickness as determined from Clause 8.22.4.1.1.
b. Calculated fire resistance between the hourly increments listed shall be determined by linear interpolation.
c. Where combustible members are framed in the wall, the thickness of solid material between the end of each member and the opposite face of the wall, or between members set in from opposite sides, shall be not less than 93 percent of the thickness shown.
d. For units in which the net cross-clausal area of cored brick in any plane parallel to the surface containing the cores is not less than 75 percent of the gross cross-clausal area measured in the same plane.

</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td>Minimum column dimension (inches)</td>
<td>8</td>
</tr>
</tbody>
</table>

Note: For SI: 1 inch = 25.4 mm.

8.22.4.1.1 Equivalent thickness.

The fire-resistance ratings of walls or partitions constructed of solid or hollow clay masonry units shall be determined from Table 8.22.4.1(1) or 8.22.4.1(2). The equivalent thickness of the clay masonry unit shall be determined by Equation 7-8 where using Table 8.22.4.1(1). The fire-resistance rating determined from Table 8.22.4.1(1) shall be permitted to be used in the calculated fire-resistance rating procedure in Clause 8.22.4.2.

$$T_e = \text{The equivalent thickness of the clay masonry unit (inches).}$$

$$V_n = \text{The net volume of the clay masonry unit (inch}^3).$$

$$L = \text{The specified length of the clay masonry unit (inches).}$$

$$H = \text{The specified height of the clay masonry unit (inches).}$$

8.22.4.1.1.1 Hollow clay units.

The equivalent thickness, $T_e$, shall be the value obtained for hollow clay units as determined in accordance with Equation 7-8. The net volume, $V_n$, of the units shall be determined using the gross volume and percentage of void area determined in accordance with ASTM C67.

8.22.4.1.1.2 Solid grouted clay units.

The equivalent thickness of solid grouted clay masonry units shall be taken as the actual thickness of the units.

8.22.4.1.1.3 Units with filled cores.

The equivalent thickness of the hollow clay masonry units is the actual thickness of the unit where completely filled with loose-fill materials of: sand, pea gravel, crushed stone, or slag that meet ASTM C33 requirements; pumice, scoria, expanded shale, expanded clay, expanded slate, expanded slag, expanded fly ash, or cinders in compliance with ASTM C331; or perlite or vermiculite meeting the requirements of ASTM C549 and ASTM C516, respectively.

8.22.4.1.2 Plaster finishes.

Where plaster is applied to the wall, the total fire-resistance rating shall be determined by the formula:

$$R = (R_n^{0.59} + pl)^{1.7}$$

(Equation 8-9)
where:

\[ R = \text{The fire-resistance rating of the assembly (hours).} \]

\[ R_n = \text{The fire-resistance rating of the individual wall (hours).} \]

\[ p_l = \text{Coefficient for thickness of plaster.} \]

Values for \( R_n^{0.59} \) for use in Equation 8-9 are given in Table 8.22.4.1(3). Coefficients for thickness of plaster shall be selected from Table 8.22.4.1(4) based on the actual thickness of plaster applied to the wall or partition and whether one or two sides of the wall are plastered.

8.22.4.1.3 Multiwythe walls with airspace.
Where a continuous airspace separates multiple wythes of the wall or partition, the total fire-resistance rating shall be determined by the formula:

\[
R = (R_1^{0.59} + R_2^{0.59} + \ldots + R_n^{0.59} + as)^{1.7} \tag{8-10}
\]

Where:

\[ R = \text{The fire-resistance rating of the assembly (hours).} \]

\[ R_1, R_2, \ldots, R_n = \text{The fire-resistance rating of the individual wythes (hours).} \]

\[ as = \text{Coefficient for continuous airspace.} \]

Values for \( R_n^{0.59} \) for use in Equation 7-10 are given in Table 8.22.4.1(3). The coefficient for each continuous airspace of 1/2 inch to 12.7 to 89 mm (31/2 inches) separating two individual wythes shall be 0.3.

8.22.4.1.4 Nonsymmetrical assemblies.
For a wall without finish on one side or having different types or thicknesses of finish on each side, the calculation procedures of this clause shall be performed twice, assuming either side to be the fire-exposed side of the wall. The fire resistance of the wall shall not exceed the lower of the two values determined.

Exception: For exterior walls with a fire separation distance greater than 1524 mm (5 feet), the fire shall be assumed to occur on the interior side only.

8.22.4.2 Multiwythe walls.
The fire-resistance rating for walls or partitions consisting of two or more dissimilar wythes shall be permitted to be determined by the formula:

\[
R = (R_1^{0.59} + R_2^{0.59} + \ldots + R_n^{0.59})^{1.7} \tag{8-11}
\]

Where:

\[ R = \text{The fire-resistance rating of the assembly (hours).} \]

\[ R_1, R_2, \ldots, R_n = \text{The fire-resistance rating of the individual wythes (hours).} \]

Values for \( R_n^{0.59} \) for use in Equation 8-11 are given in Table 8.22.4.1(3).

8.22.4.2.1 Multiwythe walls of different material.
For walls that consist of two or more wythes of different materials (concrete or concrete masonry units) in combination with clay masonry units, the fire-resistance rating of the different materials shall be determined based on the nominal width of the lintel and the minimum covering for the longitudinal reinforcement in accordance with Table 8.22.4.1(5).

8.22.4.3 Reinforced clay masonry lintels.
Fire-resistance ratings for clay masonry lintels shall be determined based on the nominal width of the lintel and the minimum covering for the longitudinal reinforcement in accordance with Table 8.22.4.1(5).

8.22.4.4 Reinforced clay masonry columns.
The fire-resistance ratings shall be determined based on the last plan dimension of the column in accordance with Table 8.22.4.1(6). The minimum cover for longitudinal reinforcement shall be 51 mm (2 inches).

8.22.4.5 Structural steel columns.
The provisions of this clause contain procedures by which the fire-resistance ratings of steel assemblies are established by calculations.

8.22.5 Steel assemblies.
The fire-resistance ratings of structural steel columns shall be based on the size of the
element and the type of protection provided in accordance with this clause.

minimum thickness galvanized or stainless steel shall be permitted to be erected with lap joints. The lap joints shall be permitted to be located anywhere around the perimeter of the column cover. The lap joints shall be secured with 1/2-inch-long No. 8 sheet metal screws spaced 12 inches on center. The column covers shall be provided with a minimum expansion clearance of 1/8 inch per linear foot between the ends of the cover and any restraining construction.

Note: For SI: 1 inch = 25.4 mm, 1 foot = 305 mm.
1. Structural steel column, either wide flange or tubular shapes.
2. Type X gypsum board or gypsum panel products in accordance with ASTM C1177, C1178, C1278, C1396 or C1658. The total thickness of gypsum board or gypsum panel products calculated as h in Clause 8.22.5.1.2 shall be applied vertically to an individual column using one of the following methods:
   1. As a single layer without horizontal joints.
   2. As multiple layers with horizontal joints not permitted in any layer.
   3. As multiple layers with horizontal joints staggered not less than 12 inches vertically between layers and not less than 8 feet vertically in any single layer. The total required thickness of gypsum board or gypsum panel products shall be determined on the basis of the specified fire-resistance rating and the weight-to-heated-perimeter ratio (W/D) of the column. For fire-resistance ratings of 2 hours or less, one of the required layers of gypsum board or gypsum panel product may be applied to the exterior of the sheet steel column covers with 1-inch long Type S screws spaced 1 inch from the wallboard edge and 8 inches on center. For such installations, 0.0149-inch minimum thickness galvanized or stainless steel shall be permitted to be erected with lap joints. The lap joints shall be permitted to be located anywhere around the perimeter of the column cover. The lap joints shall be secured with 1/2-inch-long No. 8 sheet metal screws spaced 12 inches on center. The column covers shall be provided with a minimum expansion clearance of 1/8 inch per linear foot between the ends of the cover and any restraining construction.
product to the steel studs and the third layer to the sheet metal angles at 24 inches on center. Type S screws 13/4 inches long shall be used for attaching the second layer of gypsum board or gypsum panel product to the steel studs and the fourth layer to the sheet metal angles at 12 inches on center. Type S screws 21/4 inches long shall be used for attaching the third layer of gypsum board or gypsum panel product to the steel studs at 12 inches on center.

For SI: 1 inch = 25.4 mm, 1 pound per linear foot/inch = 0.059 kg/m/mm.

**FIGURE 8.22.5.1(4) FIRE RESISTANCE OF STRUCTURAL STEEL COLUMNS PROTECTED WITH VARIOUS THICKNESSES OF TYPE X GYPSUM WALLBOARD**

a. The W/D ratios for typical wide flange columns are listed in Table 8.22.5.1(1). For other column shapes, the W/D ratios shall be determined in accordance with Clause 8.22.5.1.1.

**FIGURE 8.22.5.1(5) WIDE FLANGE STRUCTURAL STEEL COLUMNS WITH SPRAYED FIRE-RESISTANT MATERIALS**

**FIGURE 8.22.5.1(6) CONCRETE PROTECTED STRUCTURAL STEEL COLUMNS**

Note: a. Where the inside perimeter of the concrete protection is not square, L shall be taken as the average of L1 and L2. Where the thickness of concrete cover is not constant, h shall be taken as the average of h1 and h2.

b. Joints shall be protected with not less than a 1-inch thickness of ceramic fiber blanket but in no case less than one-half the thickness of the column cover (see Clause 8.22.2.1.3).
CONCRETE OR CLAY MASONRY PROTECTED STRUCTURAL STEEL COLUMNS

Note: For SI: 1 inch = 25.4 mm.

\[ d = \text{Depth of a wide flange column, outside diameter of pipe column, or outside dimension of structural tubing column (inches).} \]

\[ t_{web} = \text{Thickness of web of wide flange column (inches).} \]

\[ w = \text{Width of flange of wide flange column (inches).} \]

**Note:** For SI: 1 inch = 25.4 mm.

a. The tabulated thicknesses are based on the assumed properties of normal weight concrete given in Table 8.22.5.1(2).
### 8.22.5.1.1 General.

These procedures establish a basis for determining the fire resistance of column assemblies as a function of the thickness of fire-resistant material and, the weight, W, and heated perimeter, D, of structural steel columns. As used in these clauses, W is the average weight of a structural steel column in pounds per linear foot. The heated perimeter, D, is the inside perimeter of the fire-resistant material in inches as illustrated in Figure 8.22.5.1(1).

#### 8.22.5.1.1.1 Nonload-bearing protection.

The application of these procedures shall be limited to column assemblies in which the fire-resistant material is not designed to carry any of the load acting on the column.

#### 8.22.5.1.1.2 Embedments.

In the absence of substantiating fire-endurance test results, ducts, conduit, piping, and similar mechanical, electrical, and plumbing installations shall not be embedded in any required fire-resistant materials.

---

</tbody>
</table>

Note: For SI: 1 inch = 25.4 mm.

a. The tabulated thicknesses are based on the assumed properties of structural lightweight concrete given in Table 8.22.5.1(2).
8.22.5.1.3 Weight-to-perimeter ratio.

Table 8.22.5.1(1) contains weight-to-heated-perimeter ratios (W/D) for both contour and box fire-resistant profiles, for the wide flange shapes most often used as columns. For different fire-resistant protection profiles or column cross clauses, the weight-to-heated-perimeter ratios (W/D) shall be determined in accordance with the definitions given in this clause.

8.22.5.1.2 Gypsum wallboard protection.

The fire resistance of structural steel columns with weight-to-heated-perimeter ratios (W/D) less than or equal to 3.65 and that are protected with Type X gypsum wallboard shall be permitted to be determined from the following expression:

\[ R = 130 \left[ \frac{h(W/D)}{2} \right]^{0.75} \]  
*(Equation 8-12)*

Where:
- \( R \) = Fire resistance (minutes).
- \( h \) = Total thickness of gypsum wallboard (inches).
- \( D \) = Heated perimeter of the structural steel column (inches).
- \( W' \) = Total weight of the structural steel column and gypsum wallboard protection (pounds per linear foot).
- \( W' = W + 50hD/144 \)

8.22.5.1.2.1 Attachment.

The gypsum board or gypsum panel products shall be supported as illustrated in either Figure 8.22.5.1(2) for fire-resistance ratings of 4 hours or less, or Figure 8.22.5.1(3) for fire-resistance ratings of 3 hours or less.

8.22.5.1.2.2 Gypsum wallboard equivalent to concrete.

The determination of the fire resistance of structural steel columns from Figure 8.22.5.1(4) is permitted for various thicknesses of gypsum wallboard as a function of the weight-to-heated-perimeter ratio (W/D) of the column. For structural steel columns with weight-to-heated-perimeter ratios (W/D) greater than 3.65, the thickness of gypsum wallboard required for specified fire-resistance ratings shall be the same as the thickness determined for a W14 x 233 wide flange shape.

8.22.5.1.3 Sprayed fire-resistant materials.

The fire resistance of wide-flange structural steel columns protected with sprayed fire-resistant materials, as illustrated in Figure 8.22.5.1(5), shall be permitted to be determined from the following expression:

\[ R = [C_1(W/D) + C_2]/h \]  
*(Equation 8-13)*

Where:
- \( R \) = Fire resistance (minutes).
- \( h \) = Thickness of sprayed fire-resistant material (inches).
- \( D \) = Heated perimeter of the structural steel column (inches).
- \( C_1 \) = Material-dependent constants.
- \( C_2 \) = 
- \( W' \) = Weight of structural steel columns (pounds per linear foot).

The fire resistance of structural steel columns protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire-resistance tests in accordance with Clause 8.3.2.

8.22.5.1.3.1 Material-dependent constants.

The material-dependent constants, \( C_1 \) and \( C_2 \), shall be determined for specific fire-resistant materials on the basis of standard fire endurance tests in accordance with Clause 8.3.2. Unless evidence is submitted to the building official substantiating a broader application, this expression shall be limited to determining the fire resistance of structural steel columns with weight-to-heated-perimeter ratios (W/D) between the largest and smallest columns for which standard fire-resistance test results are available.

8.22.5.1.3.2 Identification.

Sprayed fire-resistant materials shall be identified by density and thickness required for a given fire-resistance rating.

8.22.5.1.4 Concrete-protected columns.

The fire resistance of structural steel columns protected with concrete, as illustrated in Figure 8.22.5.1(6)(a) and (b), shall be permitted to be determined from the following expression:

\[ R = R_c(1 + 0.03m) \]  
*(Equation 8-14)*
22.5.1(5) gives the thicknesses of concrete indicated in these tables apply to structural steel columns larger than those listed, with all reentrant spaces filled, Figure 8.22.5.1(6)(c).

As used in these expressions:

\[ R = \text{Fire endurance at equilibrium moisture conditions (minutes)} \]
\[ R_o = \text{Fire endurance at zero moisture content (minutes)} \]
\[ m = \text{Equilibrium moisture content of the concrete by volume (percent)} \]
\[ W = \text{Average weight of the structural steel column (pounds per foot)} \]
\[ D = \text{Heated perimeter of the structural steel column (inches)} \]
\[ h = \text{Thickness of the concrete cover (inches)} \]
\[ k = \text{Ambient temperature thermal conductivity of the concrete (Btu/hr ft °F)} \]
\[ c = \text{Ambient temperature specific heat of concrete (Btu/lb °F)} \]
\[ H = \text{Ambient temperature thermal capacity of the steel column (Btu/°F)} \]
\[ p_c = \text{Concrete density (pounds per cubic foot)} \]
\[ L = \text{Interior dimension of one side of a square concrete box protection (inches)} \]

8.22.5.1.4.1 Reentrant space filled.

For wide-flange structural steel columns completely encased in concrete with all reentrant spaces filled [Figure 8.22.5.1(6)(c)], the thermal capacity of the concrete within the reentrant spaces shall be permitted to be added to the thermal capacity of the steel column, as follows:

\[ H = 0.11 W + (p_c/144) (b_f d_A_s) \]  
(Equation 8-15)

Where:

\[ b_f = \text{Flange width of the structural steel column (inches)} \]
\[ d = \text{Depth of the structural steel column (inches)} \]
\[ A_s = \text{Cross-clausal area of the steel column (square inches)} \]

8.22.5.1.4.2 Concrete properties unknown.

If specific data on the properties of concrete are not available, the values given in Table 8.22.5.1(2) are permitted.

8.22.5.1.4.3 Minimum concrete cover.

For structural steel column encased in concrete with all reentrant spaces filled, Figure 8.22.5.1(6)(c) and Tables 8.22.5.1(7) and 8.22.5.1(8) indicate the thickness of concrete cover required for various fire-resistance ratings for typical wide-flange clauses. The equivalent thickness of concrete masonry protection (inches) [see Table 8.22.5.1(7)].

8.22.5.1.4.6 Equivalent concrete masonry thickness.

For structural steel columns protected with concrete masonry, Table 8.22.5.1(15) gives the equivalent thickness of concrete masonry...
required for various fire-resistance ratings for typical column shapes. For structural steel columns protected with clay masonry, Table 8.22.5.1(6) gives the equivalent thickness of concrete masonry required for various fire-resistance ratings for typical column shapes.

8.22.5.2 Structural steel beams and girders.

The fire-resistance ratings of structural steel beams and girders shall be based on the size of the element and the type of protection provided in accordance with this clause.

8.22.5.2.1 Determination of fire resistance.

These procedures establish a basis for determining resistance of structural steel beams and girders that differ in size from that specified in approved fire-resistance-rated assemblies as a function of the thickness of fire-resistant material and the weight (W) and heated perimeter (D) of the beam or girder. As used in these clauses, W is the average weight of a structural steel element in pounds per linear foot (plf). The heated perimeter, D, is the inside perimeter of the fire-resistant material in inches as illustrated in Figure 8.22.5.2.

8.22.5.2.1.1 Weight-to-heated perimeter.

The weight-to-heated-perimeter ratios (W/D), for both contour and box fire-resistant protection profiles, for the wide flange shapes most often used as beams or girders are given in Table 8.22.5.1(4). For different shapes, the weight-to-heated-perimeter ratios (W/D) shall be determined in accordance with the definitions given in this clause.

8.22.5.2.1.2 Beam and girder substitutions.

Except as provided for in Clause 8.22.5.2.2, structural steel beams in approved fire-resistance-rated assemblies shall be considered to be the minimum permissible size. Other beam or girder shapes shall be permitted to be substituted provided that the weight-to-heated-perimeter ratio (W/D) of the substitute beam is equal to or greater than that of the beam specified in the approved assembly.

8.22.5.2.2 Sprayed fire-resistant materials.

The provisions in this clause apply to structural steel beams and girders protected with sprayed fire-resistant materials. Larger or smaller beam and girder shapes shall be permitted to be substituted for beams specified in approved unrestrained or restrained fire-resistance-rated assemblies, provided that the thickness of the fire-resistant material is adjusted in accordance with the following expression:

\[
h_1 = h_2 \frac{[(W_2/D_2) + 0.60]}{[(W_1/D_1) + 0.60]}
\]

(Equation 8-17)

Where:

- \( h_1 \) = Thickness of sprayed fire-resistant material in inches.
- \( W \) = Weight of the structural steel beam or girder in pounds per linear foot.
- \( D \) = Heated perimeter of the structural steel beam or girder in inches.

Subscript 1 refers to the beam and fire-resistant material thickness in the approved assembly.

Subscript 2 refers to the substitute beam or girder and the required thickness of fire-resistant material.

The fire resistance of structural steel beams and girders protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire-resistance tests in accordance with Clause 8.3.2.

8.22.5.2.2.1 Minimum thickness.

The use of Equation 8-17 is subject to the following conditions:

1. The weight-to-heated-perimeter ratio for the substitute beam or girder (W2/D2) shall be not less than 0.37.

2. The thickness of fire protection materials calculated for the substitute beam or girder (T1) shall be not less than 3/8 inch (9.5 mm).

3. The unrestrained or restrained beam rating shall be not less than 1 hour.

4. Where used to adjust the material thickness for a restrained beam, the use of this procedure is limited to structural steel clauses classified as compact in accordance with this Code.

8.22.5.2.3 Structural steel trusses.

The fire resistance of structural steel trusses protected with fire-resistant materials sprayed to each of the individual truss elements shall be permitted to be determined in accordance with this clause. The thickness of the fire-resistant material shall be determined in accordance with
Clause 8.22.5.1.3. The weight-to-heated-perimeter ratio (W/D) of truss elements that can be simultaneously exposed to fire on all sides shall be determined on the same basis as columns, as specified in Clause 8.22.5.1.1. The weight-to-heated-perimeter ratio (W/D) of truss elements that directly support floor or roof assembly shall be determined on the same basis as beams and girders, as specified in Clause 8.22.5.2.1.

The fire resistance of structural steel trusses protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire-resistance tests in accordance with Clause 8.3.2.

8.22.6 Wood assemblies.

The provisions of this clause contain procedures by which the fire-resistance ratings of wood assemblies are established by calculations.

8.22.6.1 General.

This clause contains procedures for calculating the fire-resistance ratings of walls, floor/ceiling and roof/ceiling assemblies based in part on the standard method of testing referenced in Clause 8.3.2.

8.22.6.1.1 Maximum fire-resistance rating.

Fire-resistance ratings calculated for assemblies using the methods in Clause 8.22.6 shall be limited to not more than 1 hour.

8.22.6.1.2 Dissimilar membranes.

Where dissimilar membranes are used on a wall assembly that requires consideration of fire exposure from both sides, the calculation shall be made from the least fire-resistant (weaker) side.

8.22.6.2 Walls, floors and roofs.

These procedures apply to both load-bearing and nonload-bearing assemblies.

### TABLE 8.22.6.2(1)

</tbody>
</table>

Note: For SI: 1 inch = 25.4 mm.

a. These values apply only where membranes are installed on framing members that are spaced 16 inches o.c. or less.

b. Gypsum wallboard installed over framing or furring shall be installed so that all edges are supported, except 5/8-inch Type X gypsum wallboard shall be permitted to be installed horizontally with the horizontal joints staggered 24 inches each side and unsupported but finished.

c. On wood frame floor/ceiling or roof/ceiling assemblies, gypsum board shall be installed with the long dimension perpendicular to framing members and shall have all joints finished.

d. The membrane on the unexposed side shall not be included in determining the fire resistance of the assembly. Where dissimilar membranes are used on a wall assembly, the calculation shall be made from the least fire-resistant (weaker) side.

e. The time assigned is not a finished rating.

Note: For SI: 1 inch = 25.4 mm.

---

a. This table does not apply to studs or joists spaced more than 16 inches o.c.
b. All studs shall be nominal 2 × 4 and all joists shall have a nominal thickness of not less than 2 inches.
c. Allowable spans for joists shall be determined in accordance with this Code.
Note: For SI: 1 inch = 25.4 mm.
a. This table applies only to wood joist construction. It is not applicable to wood truss construction.

### TABLE 8.22.6.2(5)
TIME ASSIGNED FOR ADDITIONAL PROTECTION

<table>
<thead>
<tr>
<th>DESCRIPTION OF ADDITIONAL PROTECTION</th>
<th>FIRE RESISTANCE (minutes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add to the fire-resistance rating of wood stud walls if the spaces between the studs are completely filled with glass fiber mineral wool batts weighing not less than 2 pounds per cubic foot (0.6 pound per square foot of wall surface) or rockwool or slag material wool batts weighing not less than 3.3 pounds per cubic foot (1 pound per square foot of wall surface), or cellulose insulation having a nominal density not less than 2.6 pounds per cubic foot.</td>
<td>15</td>
</tr>
</tbody>
</table>

Note: For SI: 1 pound/cubic foot = 16.0185 kg/m3.

8.22.6.2.1 Fire-resistance rating of wood frame assemblies.

The fire-resistance rating of a wood frame assembly is equal to the sum of the time assigned to the membrane on the fire-exposed side, the time assigned to the framing members and the time assigned for additional contribution by other protective measures such as insulation. The membrane on the unexposed side shall not be included in determining the fire resistance of the assembly.

8.22.6.2.2 Time assigned to membranes.

Table 8.22.6.2(1) indicates the time assigned to membranes on the fire-exposed side.

8.22.6.2.3 Exterior walls.

For an exterior wall with a fire separation distance greater than 3048 mm (10 feet), the wall is assigned a rating dependent on the interior membrane and the framing as described in Tables 8.22.6.2(1) and 8.22.6.2(2). The membrane on the outside of the nonfire-exposed side of exterior walls with a fire separation distance greater than 3048 mm (10 feet) shall consist of sheathing, sheathing paper and siding as described in Table 8.22.6.2(3).

8.22.6.2.4 Floors and roofs.

In the case of a floor or roof, the standard test provides only for testing for fire exposure from below. Except as noted in Clause 8.3.3, Item 5, floor or roof assemblies of wood framing shall have an upper membrane consisting of a subfloor and finished floor conforming to Table 8.22.6.2(4) or any other membrane that has a contribution to fire resistance of not less than 15 minutes in Table 8.22.6.2(1).

8.22.6.2.5 Additional protection.

Table 8.22.6.2(5) indicates the time increments to be added to the fire resistance where glass fiber, rockwool, slag mineral wool or cellulose insulation is incorporated in the assembly.

8.22.6.2.6 Fastening.

Fastening of wood frame assemblies and the fastening of membranes to the wood framing members shall be done in accordance with Part 24.
PART 9: INTERIOR FINISHES

User notes:
About this part: Part 9 contains the performance requirements for controlling fire growth and smoke propagation within buildings by restricting interior finish and decorative materials. The provisions of this Part require materials used as interior finishes and decorations to meet certain flame spread index or flame propagation criteria and smoke development criteria based on the relative fire hazard associated with the occupancy. The performance of the material is evaluated based on test standards.

9.1 SCOPE

9.1.1 Scope.
The provisions of this Part shall govern the use of materials used as interior finishes, trim and decorative materials. The requirements for wall and ceiling finishes in this clause are basic requirements. Where a wall or ceiling assembly is required to provide a certain fire-resistance, a flame-spread rating or a sound transmission class rating, the wall or ceiling finishing shall be subject to the appropriate requirements in part 3 in addition to requirements in this Clause.

9.2 GENERAL

9.2.1 Interior wall and ceiling finish.
The provisions of Clause 9.3 shall limit the allowable fire performance and smoke development of interior wall and ceiling finish materials based on occupancy classification.

9.2.2 Interior floor finish.
The provisions of Clause 9.4 shall limit the allowable fire performance of interior floor finish materials based on occupancy classification.

9.2.3 Decorative materials and trim.
Decorative materials and trim shall be restricted by combustibility, fire performance or flame propagation performance criteria in accordance with Clause 9.6.

9.2.4 Applicability.
For buildings in flood hazard areas as established in this Code, interior finishes, trim and decorative materials below the elevation required by this Code shall be flood-damage-resistant materials.

9.2.5 Application.
Combustible materials shall be permitted to be used as finish for walls, ceilings, floors and other interior surfaces of buildings.

9.2.6 Windows.
Show windows in the exterior walls of the first storey above grade plane shall be permitted to be of wood or of unprotected metal framing.

9.2.7 Foam plastics.
Foam plastics shall not be used as interior finish except as provided in Clause 9.3.4. Foam plastics shall not be used as interior trim except as provided in Clause 9.6.5 or 27.4.2. This clause shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover.

9.3 WALL AND CEILING FINISHES

9.3.1 General.
Interior wall and ceiling finish materials shall be classified for fire performance and smoke development in accordance with Clause 9.3.1 or 9.3.1.2, except as shown in Clauses 9.3.1.3 through 9.3.15. Materials tested in accordance with Clause 9.3.1.1 shall not be required to be tested in accordance with Clause 9.3.1.2.

9.3.1.1 Interior wall and ceiling finish materials tested in accordance with international best practice (e.g. ASTM E84).
Interior wall and ceiling finish materials shall be classified in accordance with international best practice (e.g. ASTM E84) and comply with Clause 9.3.1.1. Materials complying with Clause 9.3.1.1 shall be considered to also comply with the requirements of Class A.

9.3.1.1 Acceptance criteria for testing wall and ceiling finish materials.
The interior finish shall comply with the following:

1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. The flame shall not spread to the outer extremity of the sample on any wall or ceiling.
3. Flashover shall not occur.
4. The peak heat release rate throughout the test shall not exceed 800 kW.
5. The total smoke released throughout the test shall not exceed 1,000 m$^2$.

9.3.1.2 Interior wall and ceiling finish materials tested in accordance with ASTM E84.

Interior wall and ceiling finish materials shall be classified in accordance with ASTM E84. Such interior finish materials shall be grouped in the following classes in accordance with their flame spread and smoke-developed indices.

- **Class A** = Flame spread index 0-25; smoke-developed index 0-450.
- **Class B** = Flame spread index 26-75; smoke-developed index 0-450.
- **Class C** = Flame spread index 76-200; smoke-developed index 0-450.

**Exception:** Materials tested in accordance with Clause 9.3.1.1 and as indicated in Clauses 9.3.1.3 through 9.3.13.

9.3.1.3 Interior wall and ceiling finish materials with different requirements.

The materials indicated in Clauses 9.3.2 through 9.3.13 shall be tested as indicated in the corresponding clauses.

9.3.2 Thickness exemption.

Materials having a thickness less than 0.9 mm (0.036 inch) applied directly to the surface of walls or ceilings shall not be required to be tested.

9.3.3 Heavy timber exemption.

Exposed portions of building elements complying with the requirements for buildings of heavy timber construction in Clause 7.2.4 or clause 24.4.11 shall not be subject to interior finish requirements except in interior exit stairways, interior exit ramps, and exit passageways.

9.3.4 Foam plastics.

Foam plastics shall not be used as interior finish except as provided in Clause 27.3.9. This clause shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover.

9.3.5 Textile wall coverings.

Where used as interior wall finish materials, textile wall coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product-mounting system, including adhesive, and shall comply with the requirements of one of the following: Clause 9.3.1.1, 803.5.1 or 9.3.5.2.

9.3.5.1 Room corner test for textile wall coverings and expanded vinyl wall coverings.

Textile wall coverings and expanded vinyl wall coverings shall meet the criteria of Clause 9.3.5.1.1 when tested in the manner intended for use in accordance with the Method B protocol of NFPA 265 using the product-mounting system, including adhesive.

9.3.5.1.1 Acceptance criteria for NFPA 265.

The interior finish shall comply with the following:

1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. The flame shall not spread to the outer extremities of the samples on the 203 by 305 mm (8-foot by 12-foot) walls.
3. Flashoverv, as defined in NFPA 265, shall not occur.
4. The total smoke release throughout the test shall not exceed 1,000 m$^2$.

9.3.5.2 Acceptance criteria for textile and expanded vinyl wall or ceiling coverings tested to ASTM E84.

Textile wall and ceiling coverings and expanded vinyl wall and ceiling coverings shall have a Class A flame spread index in accordance with ASTM E84 and be protected by an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2. Test specimen preparation and mounting shall be in accordance with ASTM E2404.
9.3.6 Textile ceiling coverings.
Where used as interior ceiling finish materials, textile ceiling coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product-mounting system, including adhesive, and shall comply with the requirements of Clause 9.3.1.1 or 9.3.5.2.

9.3.7 Expanded vinyl wall coverings.
Where used as interior wall finish materials, expanded vinyl wall coverings shall be tested in the manner intended for use, using the product-mounting system, including adhesive, and shall comply with the requirements of one of the following: Clause 9.3.1.1, 9.3.5.1 or 9.3.5.2.

9.3.8 Expanded vinyl ceiling coverings.
Where used as interior ceiling finish materials, expanded vinyl ceiling coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Clause 9.3.1.1 or 9.3.5.2.

9.3.9 High-density polyethylene (HDPE) and polypropylene (PP).
Where high-density polyethylene or polypropylene is used as an interior finish, it shall comply with Clause 9.3.1.1.

9.3.10 Site-fabricated stretch systems.
Where used as interior wall or interior ceiling finish materials, site-fabricated stretch systems containing all three components described in the definition in Part 2 shall be tested in the manner intended for use, and shall comply with the requirements of Clause 9.3.1.1 or 9.3.1.2. If the materials are tested in accordance with ASTM E84, specimen preparation and mounting shall be in accordance with ASTM E2573.

9.3.11 Laminated products factory produced with a wood substrate.
Laminated products factory produced with a wood substrate shall comply with one of the following:

1. The laminated product shall meet the criteria of Clause 9.3.1.1.1 when tested in accordance with international best practice (e.g. ASTM E84) using the product-mounting system, including adhesive.

2. The laminated product shall have a Class A, B, or C flame spread index and smoke-developed index, based on the requirements of Table 9.3.13, in accordance with ASTM E84. Test specimen preparation and mounting shall be in accordance with ASTM E2579.

9.3.12 Facings or wood veneers intended to be applied on site over a wood substrate.
Facings or veneers intended to be applied on site over a wood substrate shall comply with one of the following:

1. The facing or veneer shall meet the criteria of Clause 9.3.1.1.1 when tested in accordance with ASTM E84 using the product mounting system, including adhesive.

2. The facing or veneer shall have a Class A, B or C flame spread index and smoke-developed index, based on the requirements of Table 9.3.13, in accordance with ASTM E84. Test specimen preparation and mounting shall be in accordance with ASTM E2404.

9.3.13 Interior finish requirements based on occupancy.
Interior wall and ceiling finish shall have a flame spread index not greater than that specified in Table 9.3.13 for the group and location designated. Interior wall and ceiling finish materials tested in accordance with international best practice (e.g. NFPA 286) and meeting the acceptance criteria of Clause 9.3.1.1.1, shall be permitted to be used where a Class A classification in accordance with ASTM E84 is required.

### 9.3.14 Stability.

Interior finish materials regulated by this Part shall be applied or otherwise fastened in such a manner that such materials will not readily become detached where subjected to room temperatures of 93°C for not less than 30 minutes.

### 9.3.15 Application of interior finish materials to fire-resistance-rated or noncombustible building elements.
Where interior finish materials are applied on walls, ceilings or structural elements required to have a fire-resistance rating or to be of noncombustible construction, these finish materials shall comply with the provisions of this clause.

9.3.15.1 Direct attachment and furred construction.

Where walls, ceilings or structural elements are required by any provision in this Code to be of fire-resistance-rated or noncombustible construction, the interior finish material shall be applied directly against such construction or to furring strips not exceeding 44 mm, applied directly against such surfaces.

9.3.15.1.1 Furred construction.

If the interior finish material is applied to furring strips, the intervening spaces between such furring strips shall comply with one of the following:

1. Be filled with material that is inorganic or noncombustible.

2. Be filled with material that meets the requirements of a Class A material in accordance with Clause 9.3.1.1 or 9.3.1.2.

3. Be fire blocked at not greater than 2438 mm in every direction in accordance with Clause 8.18.

Exception: Compliance with Item 1, 2 or 3 is not required where the materials used to create the concealed space are noncombustible.

9.3.15.2 Set-out construction.

Where walls and ceilings are required to be of fire-resistance-rated or noncombustible construction and walls are set out or ceilings are dropped distances greater than specified in Clause 9.3.15.1, Class A finish materials, in accordance with Clause 9.3.1.1 or 9.3.1.2, shall be used.

Exceptions:

1. Where interior finish materials are protected on both sides by an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2).

2. Where interior finish materials are attached to noncombustible backing or furring strips installed as specified in Clause 9.3.15.1.1.

3. Where the combustible void is filled with a noncombustible material.

9.3.15.2.1 Hangers and assembly members.

The hangers and assembly members of such dropped ceilings that are below the horizontal fire-resistance-rated floor or roof assemblies shall be of noncombustible materials. The construction of each set-out wall and horizontal fire-resistance-rated floor or roof assembly shall be of fire-resistance-rated construction as required elsewhere in this Code.

Exception: In Type II and IV construction, fire-retardant-treated wood shall be permitted for use as hangers and assembly members of dropped ceilings.

9.3.15.3 Heavy timber construction.

Wall and ceiling finishes of all classes as permitted in this Part that are installed directly against the wood decking or planking of heavy timber construction in Clause 7.2.4 or clause 24.4.11 or to wood furring strips applied directly to the wood decking or planking shall be fire blocked as specified in Clause 9.3.15.1.1.

9.3.15.4 Materials.

An interior wall or ceiling finish material that is not more than 6.4 mm thick shall be applied directly onto the wall, ceiling or structural element without the use of furring strips and shall not be suspended away from the building element to which that finish material it is applied.

Exceptions:

1. Noncombustible interior finish materials.

2. Materials that meet the requirements of Class A materials in accordance with Clause 9.3.1.1 or 9.3.1.2.
where the qualifying tests were made with the material furred out from the noncombustible backing shall be permitted to be used with furring strips.

3. Materials that meet the requirements of Class A materials in accordance with Clause 9.3.1.1 or 9.3.1.2 where the qualifying tests were made with the material suspended away from the noncombustible backing shall be permitted to be used suspended away from the building element.

9.4 INTERIOR FLOOR FINISH

9.4.1 General.
Interior floor finish and floor covering materials shall comply with Clauses 9.4.2 through 9.4.4.2.

Exception: Floor finishes and coverings of a traditional type, such as wood, vinyl, linoleum or terrazzo, and resilient floor covering materials that are not comprised of fibers.

9.4.2 Classification.
Interior floor finish and floor covering materials required by Clause 9.4.4.2 to be of Class I or II materials shall be classified in accordance with ASTM E648. The classification referred to herein corresponds to the classifications determined by ASTM E648 as follows: Class I, \( 0.45 \text{ watts/cm}^2 \) or greater; Class II, \( 0.22 \text{ watts/cm}^2 \) or greater.

9.4.3 Testing and identification.
Interior floor finish and floor covering materials shall be tested by an agency in accordance with ASTM E648 and identified by a hang tag or other suitable method so as to identify the manufacturer or supplier and style, and shall indicate the interior floor finish or floor covering classification in accordance with Clause 9.4.2. Carpet-type floor coverings shall be tested as proposed for use, including underlayment. Test reports confirming the information provided in the manufacturer’s product identification shall be furnished to the building official upon request.

9.4.4 Interior floor finish requirements.
Interior floor covering materials shall comply with Clauses 9.4.4.1 and 9.4.4.2 and interior floor finish materials shall comply with Clause 9.4.4.2.

9.4.4.1 Test requirement.
In all occupancies, interior floor covering materials shall comply with the requirements of ASTM D2859.

9.4.4.2 Minimum critical radiant flux.
In all occupancies, interior floor finish and floor covering materials in enclosures for stairways and ramps, exit passageways, corridors and rooms or spaces not separated from corridors by partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux. The minimum critical radiant flux shall be not less than Class I in Groups I-1, I-2 and I-3 and not less than Class II in Groups A, B, E, H, I-4, M, R-1, R-2 and S.

Exception: Where a building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.1.2, Class II materials are permitted in any area where Class I materials are required, and materials complying with ASTM D2859 are permitted in any area where Class II materials are required.

9.5 COMBUSTIBLE MATERIALS IN TYPES I CONSTRUCTION

9.5.1 Application.
Combustible materials installed on or embedded in floors of buildings of Type I construction shall comply with Clauses 9.5.1.1 through 805.1.3.

Exception: Stages and platforms constructed in accordance with this Code respectively.

9.5.1.1 Subfloor construction.
Floor sleepers, bucks and nailing blocks shall not be constructed of combustible materials, unless the space between the fire-resistant floor assembly and the flooring is either solidly filled with noncombustible materials or
fireblocked in accordance with Clause 8.18, and provided that such open spaces shall not extend under or through permanent partitions or walls.

9.5.1.2 Wood finish flooring.
Wood finish flooring is permitted to be attached directly to the embedded or fireblocked wood sleepers and shall be permitted where cemented directly to the top surface of fire-resistance-rated floor assemblies or directly to a wood subfloor attached to sleepers as provided for in Clause 9.5.1.1.

9.5.1.3 Insulating boards.
Combustible insulating boards not more than 12.7 mm (1/2 inch) thick and covered with finish flooring are permitted where attached directly to a noncombustible floor assembly or to wood subflooring attached to sleepers as provided for in Clause 9.5.1.1.

9.6 DECORATIVE MATERIALS AND TRIM

9.6.1 General.
The following requirements shall apply to all occupancies:

1. Furnishings or decorative materials of an explosive or highly flammable character shall not be used.

2. Fire-retardant coatings in existing buildings shall be maintained so as to retain the effectiveness of the treatment under service conditions encountered in actual use.

3. Furnishings or other objects shall not be placed to obstruct exits, access thereto, egress therefrom or visibility thereof.

4. The permissible amount of decorative vegetation and noncombustible decorative materials shall not be limited.

9.6.2 Combustible decorative materials.
In Groups A, B, E, I, M and R-1 and in dormitories in Group R-2, curtains, draperies, fabric hangings and similar combustible decorative materials suspended from walls or ceilings shall comply with Clause 9.6.4 and shall not exceed 10 percent of the specific wall or ceiling area to which such materials are attached.

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered to be interior finish, shall comply with Clause 9.3 and shall not be considered to be decorative materials or furnishings.

Exceptions:

1. In auditoriums in Group A, the permissible amount of curtains, draperies, fabric hangings and similar combustible decorative materials suspended from walls or ceilings shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an approved automatic sprinkler system in accordance with Clause 10.3.3.1.1 and where the material is installed in accordance with Clause 9.3.15 of this Code.

2. In Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and similar decorative materials suspended from walls or ceiling shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with an approved automatic sprinkler system installed in accordance with Clause 10.3.3.1.

3. In Group B and M occupancies, the amount of combustible fabric partitions suspended from the ceiling and not supported by the floor shall comply with Clause 9.6.4 and shall not be limited.

4. The 10-percent limit shall not apply to curtains, draperies, fabric hangings and similar combustible decorative materials used as window coverings.

9.6.3 Occupancy-based requirements.
Occupancy-based requirements for combustible decorative materials, other than decorative vegetation, not complying with
Clause 9.6.4 shall comply with Clauses 9.7.5.1 through 9.7.5.6 of the Ghana Fire Code.

9.6.4 Acceptance criteria and reports.
Where required to exhibit improved fire performance, curtains, draperies, fabric hangings and similar combustible decorative materials suspended from walls or ceilings shall be tested by an approved agency and meet the flame propagation performance criteria, or exhibit a maximum heat release rate of 100 kW when tested using the 20 kW ignition source. Reports of test results shall be prepared in accordance with the test method used and furnished to the building official upon request.

9.6.5 Foam plastic.
Foam plastic used as trim in any occupancy shall comply with Clause 27.4.2.

9.6.6 Pyroxylin plastic.
Imitation leather or other material consisting of or coated with a pyroxylin or similarly hazardous base shall not be used in Group A occupancies.

9.6.7 Interior trim.
Material, other than foam plastic used as interior trim, shall have a minimum Class C flame spread and smoke-developed index when tested in accordance with ASTM E84, as described in Clause 9.3.1.2. Combustible trim, excluding handrails and guardrails, shall not exceed 10 percent of the specific wall or ceiling area to which it is attached.

9.6.8 Interior floor-wall base.
Interior floor-wall base that is 152 mm (6 inches) or less in height shall be tested in accordance with Clause 9.4.2 and shall be not less than Class II. Where a Class I floor finish is required, the floor-wall base shall be Class I.

Exception: Interior trim materials that comply with Clause 9.6.7.

9.7 INSULATION

9.7.1 Insulation.
Thermal and acoustical insulation shall comply with Clause 3.1 in addition to requirements in this Clause.
9.10.2.1 Waterproofing of interior finishes

Waterproof finish shall be provided to a height of not less than 1.8m above the floor in shower stalls, 1.2m above the rims of bathtubs equipped with showers and 400mm above the rims of bathtubs not equipped with showers.

9.10.2.2 Waterproof finish

Waterproof finish shall consist of granite, marble, ceramic, plastic or metal tile, sheet vinyl or linoleum etc.

9.10.3 Wall tile

9.10.3.1 Wall tile base and adhesive

Ceramic tile shall be set in a mortar base or applied with adhesive. Plastic tile shall be applied with an adhesive.

9.10.3.2 Mortar for ceramic tile

When ceramic tile is applied to a mortar base the cementitious material shall consist of one part Portland cement to not more than ¼ part of lime or clay pozzolana by volume. This shall be mixed with not less than three nor more than five parts of sand per part of cementitious material by volume. Ceramic tile applied to a mortar base shall be thoroughly soaked and pressed into place forcing the mortar into the joints while the tile is wet.

9.10.3.3 Adhesive for ceramic tile

Adhesives to attach ceramic or plastic tile shall be applied to the finish coat or brown coat of plaster that has been steel-trowelled to an even surface or to masonry provided the masonry has an even surface.

9.11 FLOORING

9.11.1 General

9.11.1.1 Finished flooring shall be provided in all residential occupancies.

9.11.2 Wood strip flooring

9.11.2.1 Dimensions

The thickness of wood strip flooring shall conform to Table 9.21.2A

<table>
<thead>
<tr>
<th>Type of Flooring</th>
<th>Maximum Joist Spacing, mm</th>
<th>Minimum Actual Thickness of Flooring, mm</th>
</tr>
</thead>
<tbody>

<td>32</td>
</tr>
</tbody>
</table>

9.11.2.2 Underlay

Wood strip flooring shall not be laid parallel to timber sub-flooring unless a separate underlay is provided.

9.11.2.3 Laying of wood strip flooring

If wood strip flooring is applied without a subfloor, it shall be laid at right angles to the joists so that end joists are staggered and occur over supports or are end matched. It
shall be laid so that no two adjoining strips break joints in the same space between supports and each strip bears on no fewer than two supports.

9.11.3 Parquet flooring

9.11.3.1 Adhesive used to attach parquet block flooring shall be suitable for bonding wood to the applicable subfloor material.

9.11.4 Ceramic tile

9.11.4.1 Ceramic tile shall be set in a mortar bed or applied to a sound smooth base with a suitable adhesive.
PART 10: FIRE PROTECTION AND LIFE SAFETY SYSTEMS

User note:

About this part: Part 10 prescribes the minimum requirements for active fire protection equipment systems to perform the functions of detecting a fire, alerting the occupants or fire department of a fire emergency, mass notification, gas detection, controlling smoke and controlling or extinguishing the fire. Generally, the requirements are based on the occupancy, the height and the area of the building, because these are the factors that most affect firefighting capabilities and the relative hazard of a specific building or portion thereof.

10.1 GENERAL

10.1.1 Scope.

The provisions of this part shall specify where fire protection and life safety systems are required and shall apply to the design, installation and operation of fire protection systems.

10.1.2 Fire protection systems.

Fire protection systems shall be installed, repaired, operated and maintained in accordance with this Code and the Ghana Fire Code.

Any fire protection system for which an exception or reduction to the provisions of this Code has been granted shall be considered to be a required system.

Exception: Any fire protection system or portion thereof not required by this Code shall be permitted to be installed for partial or complete protection provided that such system meets the requirements of this Code.

10.1.3 Modifications.

Persons shall not remove or modify any fire protection system installed or maintained under the provisions of this Code without the approval by the Ghana National Fire Service.

10.1.4 Threads.

Threads provided for Fire Service connections to sprinkler systems, standpipes, yard hydrants or any other fire hose connection shall be compatible with the connections used by the Ghana National Fire Service.

10.1.5 Acceptance tests.

Fire protection systems shall be tested in accordance with the requirements of this Code. The tests shall be conducted in the presence of the Fire Inspector. Tests required by this Code and the standards listed in this Code shall be conducted at the expense of the owner or the owner's authorized agent. It shall be unlawful to occupy portions of a structure until the required fire protection systems within that portion of the structure have been tested and approved.

10.1.6 Supervisory service.

Where required, fire protection systems shall be monitored by an accredited Fire protection service contractor (Service provider) and certified yearly by the Ghana National Fire Service.

10.1.6.1 Automatic sprinkler systems.

Automatic sprinkler systems shall be monitored by an approved supervising station.

Exceptions:

1. A supervising station is not required for automatic sprinkler systems protecting one- and two-family dwellings.

2. Limited area systems in accordance with Clause 10.3.3.8.

10.1.6.2 Integrated testing.

Where two or more fire protection or life safety systems are interconnected, the intended response of subordinate fire protection and life safety systems shall be verified when required testing of the initiating system is conducted. In addition, integrated testing shall be performed in accordance with Clauses 10.6.2.1 and 10.6.2.2.

10.1.6.2.1 High-rise buildings.

For high-rise buildings, integrated testing shall comply with the Ghana Fire Code, with an integrated test performed prior to issuance of the certificate of occupancy and at intervals not exceeding 10 years, unless otherwise specified.
by an integrated system test plan prepared in accordance with the Ghana Fire Code. If an equipment failure is detected during integrated testing, a repeat of the integrated test shall not be required, except as necessary to verify operation of fire protection or life safety functions that are initiated by equipment that was repaired or replaced.

10.1.6.2.2 Smoke control systems.
Where a fire alarm system is integrated with a smoke control system as outlined in Clause 10.9, integrated testing shall comply with the Ghana Fire Code, with an integrated test performed prior to issuance of the certificate of occupancy and at intervals not exceeding 10 years, unless otherwise specified by an integrated system test plan prepared in accordance with the Ghana Fire Code. If an equipment failure is detected during integrated testing, a repeat of the integrated test shall not be required, except as necessary to verify operation of fire protection or life safety functions that are initiated by equipment that was repaired or replaced.

10.1.6.3 Fire alarm systems.
Fire alarm systems required by the provisions of Clause 10.7.2 of this Code and Clauses 10.7.2 and 10.7.9 of the Ghana Fire Code shall be monitored by an approved supervising station in accordance with Clause 10.7.6.6 of this Code.

Exceptions:
1. Single- and multiple-station smoke alarms required by Clause 10.7.2.10.
2. Smoke detectors in Group I-3 occupancies.
3. Supervisory service is not required for automatic sprinkler systems in one- and two-family dwellings.

10.1.6.4 Group H.
Supervision and monitoring of emergency alarm, detection and automatic fire-extinguishing systems in Group H occupancies shall be in accordance with the Ghana Fire Code.

10.1.7 Fire areas.
Where buildings, or portions thereof, are divided into fire areas so as not to exceed the limits established for requiring a fire protection system in accordance with this part, such fire areas shall be separated by fire walls constructed in accordance with Clause 8.6, fire barriers constructed in accordance with Clause 8.7, or horizontal assemblies constructed in accordance with Clause 8.11, or a combination thereof having a fire-resistance rating of not less than that determined in accordance with Clause 8.7.3.10.

10.2 FIRE PUMP AND RISER ROOM SIZE

10.2.1 Pump and riser room size.
Where provided, fire pump rooms and automatic sprinkler system riser rooms shall be designed with adequate space for all equipment necessary for the installation, as defined by the manufacturer, with sufficient working room around the stationary equipment. Clearances around equipment to elements of permanent construction, including other installed equipment and appliances, shall be sufficient to allow inspection, service, repair or replacement without removing such elements of permanent construction or disabling the function of a required fire-resistance-rated assembly. Fire pump and automatic sprinkler system riser rooms shall be provided with doors and unobstructed passageways large enough to allow removal of the largest piece of equipment.

10.2.1.1 Access.
Automatic sprinkler system risers, fire pumps and controllers shall be provided with ready access. Where located in a fire pump room or automatic sprinkler system riser room, the door shall be permitted to be locked provided that the key is available at all times.

10.2.2.1 Marking on access doors.
Access doors for automatic sprinkler system riser rooms and fire pump rooms shall be labeled with an approved sign. The lettering shall be in contrasting color to the background. Letters shall have a minimum height of 51 mm (2 inches) with a minimum stroke of 10 mm (3/8 inch).
10.2.1.3 Environment.

Automatic sprinkler system riser rooms and fire pump rooms shall be maintained at a temperature of not less than 4°C (40°F). Heating units shall be permanently installed.

10.2.1.4 Lighting.

Permanently installed artificial illumination shall be provided in the automatic sprinkler system riser rooms and fire pump rooms.

10.3 AUTOMATIC SPRINKLER SYSTEMS

10.3.1 General.

Automatic sprinkler systems shall comply with this clause.

10.3.1.1 Alternative protection.

Alternative automatic fire-extinguishing systems complying with Clause 10.4 shall be permitted instead of automatic sprinkler protection where recognized by the applicable standard and approved by the fire Code official.

10.3.2 Where required.

Approved automatic sprinkler systems in new buildings and structures shall be provided in the locations described in Clauses 10.3.2.1 through 10.3.2.12.

**Exception:** Spaces or areas in telecommunications buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided that those spaces or areas are equipped throughout with an automatic smoke detection system in accordance with Clause 10.7.2 and are separated from the remainder of the building by not less than 1-hour fire barriers constructed in accordance with Clause 8.7 or not less than 2-hour horizontal assemblies constructed in accordance with Clause 8.11, or both.

10.3.2.1 Group A.

An automatic sprinkler system shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this clause.

10.3.2.1.1 Group A-1.

An automatic sprinkler system shall be provided throughout stories containing Group A-1 occupancies and throughout all stories from the Group A-1 occupancy to and including the levels of exit discharge serving that occupancy where one of the following conditions exists:

1. The fire area exceeds 1115 m$^2$ (12,000 square feet).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.
4. The fire area contains a multitheater complex.

10.3.2.1.2 Group A-2.

An automatic sprinkler system shall be provided throughout stories containing Group A-2 occupancies and throughout all stories from the Group A-2 occupancy to and including the levels of exit discharge serving that occupancy where one of the following conditions exists:

1. The fire area exceeds 464 m$^2$ (5,000 square feet).
2. The fire area has an occupant load of 100 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

10.3.2.1.3 Group A-3.

An automatic sprinkler system shall be provided throughout stories containing Group A-3 occupancies and throughout all stories from the Group A-3 occupancy to and including
the levels of exit discharge serving that occupancy where one of the following conditions exists:

1. The fire area exceeds 1115 m$^2$ (12,000 square feet).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

10.3.2.1.4 Group A-4.

An automatic sprinkler system shall be provided throughout stories containing Group A-4 occupancies and throughout all stories from the Group A-4 occupancy to and including the levels of exit discharge serving that occupancy where one of the following conditions exists:

1. The fire area exceeds 1115 m$^2$ (12,000 square feet).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

10.3.2.1.5 Group A-5.

An automatic sprinkler system shall be provided for all enclosed Group A-5 accessory use areas in excess of 93 m² (1,000 square feet).

10.3.2.1.5.1 Spaces under grandstands or bleachers.

Enclosed spaces under grandstands or bleachers shall be equipped with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 where either of the following exist:

1. The enclosed area is 93 m² (1,000 square feet) or less and is not constructed in accordance with Clause 11.29.1.1.1.

2. The enclosed area exceeds 93 m² (1,000 square feet).

10.3.2.1.6 Assembly occupancies on roofs.

Where an occupied roof has an assembly occupancy with an occupant load exceeding 100 for Group A-2 and 300 for other Group A occupancies, all floors between the occupied roof and the level of exit discharge shall be equipped with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

Exception: Open parking garages of Type I or Type II construction.

10.3.2.1.7 Multiple fire areas.

An automatic sprinkler system shall be provided where multiple fire areas of Group A-1, A-2, A-3 or A-4 occupancies share exit or exit access components and the combined occupant load of theses fire areas is 300 or more.

10.2.2 Ambulatory care facilities.

An automatic sprinkler system shall be installed throughout the entire floor containing an ambulatory care facility where either of the following conditions exist at any time:

1. Four or more care recipients are incapable of self-preservation.
2. One or more care recipients that are incapable of self-preservation are located at other than the level of exit discharge serving such a facility.

In buildings where ambulatory care is provided on levels other than the level of exit discharge, an automatic sprinkler system shall be installed throughout the entire floor as well as all floors below where such care is provided, and all floors between the level of ambulatory care and the nearest level of exit discharge, the level of exit discharge, and all floors below the level of exit discharge.

Exception: Floors classified as an open parking garage are not required to be sprinklered.
10.3.2.3 Group E.
An automatic sprinkler system shall be provided for Group E occupancies as follows:

1. Throughout all Group E fire areas greater than 12,000 square feet \( (1115 \text{ m}^2) \) in area.

2. The Group E fire area is located on a floor other than a level of exit discharge serving such occupancies.

**Exception:** In buildings where every classroom has not fewer than one exterior exit door at ground level, an automatic sprinkler system is not required in any area below the lowest level of exit discharge serving that area.

3. The Group E fire area has an occupant load of 300 or more.

10.3.2.4 Group F-1.
An automatic sprinkler system shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 fire area exceeds 12,000 square feet \( (1115 \text{ m}^2) \).

2. A Group F-1 fire area is located more than three stories above grade plane.

3. The combined area of all Group F-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet \( (2230 \text{ m}^2) \).

4. A Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet \( (232 \text{ m}^2) \).

10.3.2.4.1 Woodworking operations.
An automatic sprinkler system shall be provided throughout all Group F-1 occupancy fire areas that contain woodworking operations in excess of 2,500 square feet \( (232 \text{ m}^2) \) in area that generate finely divided combustible waste or use finely divided combustible materials.

10.3.2.5 Group H.
Automatic sprinkler systems shall be provided in high-hazard occupancies as required in Clauses 10.3.2.5.1 through 10.3.2.5.3.

10.3.2.5.1 General.
An automatic sprinkler system shall be installed in Group H occupancies.

10.3.2.5.2 Group H-5 occupancies.
An automatic sprinkler system shall be installed throughout buildings containing Group H-5 occupancies. The design of the sprinkler system shall be not less than that required by this Code for the occupancy hazard classifications in accordance with Table 10.3.2.5.2.

Where the design area of the sprinkler system consists of a corridor protected by one row of sprinklers, the maximum number of sprinklers required to be calculated is 13.

**TABLE 10.3.2.5.2**

10.3.2.5.3 Pyroxylin plastics.
An automatic sprinkler system shall be provided in buildings, or portions thereof, where cellulose nitrate film or pyroxylin plastics are manufactured, stored or handled in quantities exceeding 45 kg (100 pounds).

10.3.2.6 Group I.
An automatic sprinkler system shall be provided throughout buildings with a Group I fire area.
Exceptions:

1. An automatic sprinkler system installed in accordance with Clause 10.3.3.1.2 shall be permitted in Group I-1, Condition 1 facilities.

2. An automatic sprinkler system is not required where Group I-4 day care facilities are at the level of exit discharge and where every room where care is provided has not less than one exterior exit door.

3. In buildings where Group I-4 day care is provided on levels other than the level of exit discharge, an automatic sprinkler system installed on the entire floor where care is provided, all floors between the level of care and the level of exit discharge, and all floors below the level of exit discharge other than areas classified as an open parking garage.

10.3.2.7 Group M.

An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M fire area exceeds $1115 \text{ m}^2$ (12,000 square feet).

2. A Group M fire area is located more than three stories above grade plane.

3. The combined area of all Group M fire areas on all floors, including any mezzanines, exceeds $2230 \text{ m}^2$ (24,000 square feet).

4. A Group M occupancy used for the display and sale of upholstered furniture or mattresses exceeds $464 \text{ m}^2$ (5,000 square feet).

10.3.2.7.1 High-piled storage.

An automatic sprinkler system shall be provided in accordance with the Ghana Fire Code in all buildings of Group M where storage of merchandise is in high-piled or rack storage arrays.

10.3.2.8 Group R.

An automatic sprinkler system installed in accordance with Clause 10.3.3 shall be provided throughout all buildings with a Group R fire area.

10.3.2.8.1 Group R-3.

An automatic sprinkler system installed in accordance with Clause 10.3.3.1.3 shall be permitted in Group R-3 occupancies.

10.3.2.8.2 Group R-4, Condition 1.

An automatic sprinkler system installed in accordance with Clause 10.3.3.1.3 shall be permitted in Group R-4, Condition 1 occupancies.

10.3.2.8.3 Group R-4, Condition 2.

An automatic sprinkler system installed in accordance with Clause 10.3.3.1.2 shall be permitted in Group R-4, Condition 2 occupancies.

10.3.2.8.4 Care facilities.

An automatic sprinkler system installed in accordance with Clause 10.3.3.1.3 shall be permitted in care facilities with five or fewer individuals in a single-family dwelling.

10.3.2.9 Group S-1.

An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 fire area exceeds $1115 \text{ m}^2$ (12,000 square feet).

2. A Group S-1 fire area is located more than three stories above grade plane.

3. The combined area of all Group S-1 fire areas on all floors, including
any mezzanines, exceeds 2230 m$^2$ (24,000 square feet).

4. A Group S-1 fire area used for the storage of commercial motor vehicles where the fire area exceeds 464 m$^2$ (5,000 square feet).

5. A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 232 m$^2$ (2,500 square feet).

10.3.2.9.1 Repair garages.

An automatic sprinkler system shall be provided throughout all buildings used as repair garages in accordance with this, as shown:

1. Buildings having two or more stories above grade plane, including basements, with a fire area containing a repair garage exceeding 929 m$^2$ (10,000 square feet).

2. Buildings not more than one story above grade plane, with a fire area containing a repair garage exceeding 1115 m$^2$ (12,000 square feet).

4. A Group S-1 fire area used for the repair of commercial motor vehicles where the fire area exceeds 464 m$^2$ (5,000 square feet).

10.3.2.9.2 Bulk storage of tires.

Buildings and structures where the area for the storage of tires exceeds 566 m$^3$ (20,000 cubic feet) shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

10.3.2.10 Group S-2 enclosed parking garages.

An automatic sprinkler system shall be provided throughout buildings classified as enclosed parking garages in accordance with Clause 4.6.6 where either of the following conditions exists:

1. Where the fire area of the enclosed parking garage exceeds 1115 m$^2$ (12,000 square feet).

2. Where the enclosed parking garage is located beneath other groups.

**Exception:** Enclosed parking garages located beneath Group R-3 occupancies.

10.3.2.10.1 Commercial parking garages.

An automatic sprinkler system shall be provided throughout buildings used for storage of commercial motor vehicles where the fire area exceeds 5,000 square feet (464 m$^2$).

10.3.2.11 Specific building areas and hazards.

In all occupancies other than Group U, an automatic sprinkler system shall be installed for building design or hazards in the locations set forth in Clauses 10.3.2.11.1 through 10.3.2.11.6.

10.3.2.11.1 Stories without openings.

An automatic sprinkler system shall be installed throughout all stories, including basements, of all buildings where the floor area exceeds 139.4 m$^2$ (1,500 square feet) and where the storey does not comply with the following criteria for exterior wall openings:

1. Openings below grade that lead directly to ground level by an exterior stairway complying with this Code or an outside ramp complying with Clause 11.12. Openings shall be located in each 15 240 mm (50 linear feet), or fraction thereof, of exterior wall in the storey on not less than one side. The required openings shall be distributed such that the lineal distance between adjacent openings does not exceed 15 240 mm (50 feet).
2. Openings entirely above the adjoining ground level totaling not less than 1.86 m² (20 square feet) in each 15 240 mm (50 linear feet), or fraction thereof, of exterior wall in the storey on not fewer than one side. The required openings shall be distributed such that the lineal distance between adjacent openings does not exceed 15 240 mm (50 feet). The height of the bottom of the clear opening shall not exceed 1118 mm (44 inches) measured from the floor.

10.3.2.11.1.1 Opening dimensions and access.

Openings shall have a minimum dimension of not less than 762 mm (30 inches). Access to such openings shall be provided for the fire department from the exterior and shall not be obstructed in a manner such that fire fighting or rescue cannot be accomplished from the exterior.

10.3.2.11.1.2 Openings on one side only.

Where openings in a storey are provided on only one side and the opposite wall of such storey is more than 22 860 mm (75 feet) from such openings, the storey shall be equipped throughout with an approved automatic sprinkler system, or openings shall be provided on not fewer than two sides of the storey.

10.3.2.11.1.3 Basements.

Where any portion of a basement is located more than 22 860 mm (75 feet) from openings required by Clause 10.3.2.11.1, or where walls, partitions or other obstructions are installed that restrict the application of water from hose streams, the basement shall be equipped throughout with an approved automatic sprinkler system.

10.3.2.11.2 Rubbish and linen chutes.

An automatic sprinkler system shall be installed at the top of rubbish and linen chutes and in their terminal rooms. Chutes shall have additional sprinkler heads installed at alternate floors and at the lowest intake. Where a rubbish chute extends through a building more than one floor below the lowest intake, the extension shall have sprinklers installed that are recessed from the drop area of the chute and protected from freezing in accordance with Clause 10.3.3.1.1. Such sprinklers shall be installed at alternate floors, beginning with the second level below the last intake and ending with the floor above the discharge. Access to sprinklers in chutes shall be provided for servicing.

10.3.2.11.3 Buildings 55 feet or more in height.

An automatic sprinkler system shall be installed throughout buildings that have one or more stories with an occupant load of 30 or more located 16 764 mm (55 feet) or more above the lowest level of fire department vehicle access, measured to the finished floor.

Exceptions:
1. Open parking structures.
2. Occupancies in Group F-2.

10.3.2.11.4 Ducts conveying hazardous exhausts.

Where required by the International Mechanical Code, automatic sprinklers shall be provided in ducts conveying hazardous exhaust or flammable or combustible materials.

Exception: Ducts where the largest cross-clausal diameter of the duct is less than 254 mm (10 inches).

10.3.2.11.5 Commercial cooking operations.

An automatic sprinkler system shall be installed in commercial kitchen exhaust hood and duct systems where an automatic sprinkler system is used to comply with Clause 10.4.

10.3.2.11.6 Other required suppression systems.

In addition to the requirements of Clause 10.3.2, the provisions indicated in Table 10.3.2.11.6 require the installation of a fire suppression system for certain buildings and areas.

340
10.3.2.12 During construction.

Automatic sprinkler systems required during construction, alteration and demolition operations shall be provided in accordance with the Ghana Fire Code.

10.3.3 Installation requirements.

Automatic sprinkler systems shall be designed and installed in accordance with Clauses 10.3.3.1 through 10.3.3.8.

10.3.3.1 Standards.

Sprinkler systems shall be designed and installed in accordance with Clause 10.3.3.1.1 unless otherwise permitted by Clauses 10.3.3.1.2 and 10.3.3.1.3 and other parts of this Code, as applicable.

10.3.3.1.1 NFPA 13 sprinkler systems.

Where the provisions of this Code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with this clause, sprinklers shall be installed throughout in accordance with the Ghana Fire Code except as provided in Clauses 10.3.3.1.1.1 and 10.3.3.1.1.2.

10.3.3.1.1.1 Exempt locations.

Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an approved automatic fire detection system in accordance with Clause 10.7.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from a room merely because it is damp, of fire-resistance-rated construction or contains electrical equipment.

1. A room where the application of water, or flame and water, constitutes a serious life or fire hazard.

2. A room or space where sprinklers are considered undesirable because of the nature of the contents, where approved by the fire Code official.

3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a fire-resistance rating of not less than 2 hours.

4. Rooms or areas that are of noncombustible construction with wholly noncombustible contents.

5. Fire service access elevator machine rooms and machinery spaces.

6. Machine rooms, machinery spaces, control rooms and control spaces associated with occupant evacuation elevators designed in accordance with this Code.

10.3.3.1.2 Bathrooms.

In Group R occupancies sprinklers shall not be required in bathrooms that do not exceed 5 m (255 square feet) in area and are located within individual dwelling units or sleeping units, provided that walls and ceilings, including the walls and ceilings behind a shower enclosure or tub, are of noncombustible or limited-combustible materials with a 15-minute thermal barrier rating.

10.3.3.1.2 NFPA 13R sprinkler systems.

Automatic sprinkler systems in Group R occupancies up to and including four stories in height in buildings not exceeding 18 288 mm (60 feet) in height above grade plane shall be permitted to be installed throughout in accordance with the Ghana Fire Code.

The number of stories of Group R occupancies constructed in accordance with Clauses 510.2 and 510.4 shall be measured from the horizontal assembly creating separate buildings.

10.3.3.1.2.1 Balconies and decks.

Sprinkler protection shall be provided for exterior balconies, decks and ground floor patios of dwelling units and sleeping units where either of the following conditions exists:

<table>
<thead>

<td>Sprinkler system requirements as set forth in Clause 10.3.2.11.6 of the Ghana Fire Code</td>
<td></td>
</tr>
</tbody>
</table>
1. The building is of Type IV construction, provided that there is a roof or deck above.

2. Exterior balconies, decks and ground floor patios of dwelling units and sleeping units are constructed in accordance with Clause 8.5.2.3.1, Exception 3.

Sidewall sprinklers that are used to protect such areas shall be located such that their deflectors are within 1 inch (25 mm) to 6 inches (152 mm) below the structural members and a maximum distance of 14 inches (356 mm) below the deck of the exterior balconies and decks that are constructed of open wood joist construction.

10.3.3.1.2.2 Open-ended corridors.

Sprinkler protection shall be provided in open-ended corridors and associated exterior stairways and ramps as specified in Clause 11.27.6, Exception 3.

10.3.3.1.2.3 Attics.

Attic protection shall be provided as follows:

1. Attics that are used or intended for living purposes or storage shall be protected by an automatic sprinkler system.

2. Where fuel-fired equipment is installed in an unsprinklered attic, not fewer than one quick-response intermediate temperature sprinkler shall be installed above the equipment.

3. Where located in a building of Type II, Type III or Type IV construction designed in accordance with Clause 510.2 or 510.4, attics not required by Item 1 to have sprinklers shall comply with one of the following if the roof assembly is located more than 55 feet (16 764 mm) above the lowest level of required fire department vehicle access:

   3.1. Provide automatic sprinkler system protection.

   3.2. Construct the attic using noncombustible materials.

   3.3. Construct the attic using fire-retardant-treated wood complying with Clause 24.3.2.

3.4. Fill the attic with noncombustible insulation.

The height of the roof assembly shall be determined by measuring the distance from the lowest required fire vehicle access road surface adjacent to the building to the eave of the highest pitched roof, the interclause of the highest roof to the exterior wall, or the top of the highest parapet, whichever yields the greatest distance. For the purpose of this measurement, required fire vehicle access roads shall include only those roads that are necessary for compliance with Clause 503 of the Ghana Fire Code.

4. Group R-4, Condition 2 occupancy attics not required by Item 1 to have sprinklers shall comply with one of the following:

4.1. Provide automatic sprinkler system protection.

4.2. Provide a heat detection system throughout the attic that is arranged to activate the building fire alarm system.

4.3. Construct the attic using noncombustible materials.

4.4. Construct the attic using fire-retardant-treated wood complying with Clause 24.3.2.

4.5. Fill the attic with noncombustible insulation.

10.3.3.1.3 NFPA 13D sprinkler systems.

Automatic sprinkler systems installed in one- and two-family dwellings; Group R-3; Group R-4, Condition 1; and townhouses shall be permitted to be installed throughout in accordance with NFPA 13D.

10.3.3.2 Quick-response and residential sprinklers.

Where automatic sprinkler systems are required by this Code, quick-response or residential automatic sprinklers shall be installed in all of the following areas in accordance with Clause 10.3.3.1 and their listings:
1. Throughout all spaces within a smoke compartment containing care recipient sleeping units in Group I-2 in accordance with this Code.

2. Throughout all spaces within a smoke compartment containing treatment rooms in ambulatory care facilities.

3. Dwelling units and sleeping units in Group I-1 and R occupancies.

4. Light-hazard occupancies as defined in the Ghana Fire Code.

10.3.3.3 Obstructed locations.
Automatic sprinklers shall be installed with regard to obstructions that will delay activation or obstruct the water distribution pattern and shall be in accordance with the applicable automatic sprinkler system standard that is being used. Automatic sprinklers shall be installed in or under covered kiosks, displays, booths, concession stands, or equipment that exceeds 1219 mm (4 feet) in width. Not less than a 914 mm (3-foot) clearance shall be maintained between automatic sprinklers and the top of piles of combustible fibers.

Exception: Kitchen equipment under exhaust hoods protected with a fire-extinguishing system in accordance with Clause 10.4.

10.3.3.4 Actuation.
Automatic sprinkler systems shall be automatically actuated unless specifically provided for in this Code.

10.3.3.5 Water supplies.
Water supplies for automatic sprinkler systems shall comply with this clause and the standards referenced in Clause 10.3.3.1. The potable water supply shall be protected against backflow in accordance with the requirements of this clause and the International Plumbing Code. For connections to public waterworks systems, the water supply test used for design of fire protection systems shall be adjusted to account for seasonal and daily pressure fluctuations based on information from the water supply authority and as approved by the fire Code official.

10.3.3.5.1 Domestic services.
Where the domestic service provides the water supply for the automatic sprinkler system, the supply shall be in accordance with this clause.

10.3.3.5.2 Residential combination services.
A single combination water supply shall be allowed provided that the domestic demand is added to the sprinkler demand as required by the Ghana Fire Code.

10.3.3.6 Hose threads.
Fire hose threads and fittings used in connection with automatic sprinkler systems shall be as prescribed by the fire Code official.

10.3.3.7 Fire department connections.
Fire department connections for automatic sprinkler systems shall be installed in accordance with Clause 10.12.

10.3.3.8 Limited area sprinkler systems.
Limited area sprinkler systems shall be in accordance with the standards listed in Clause 10.3.3.1 except as provided in Clauses 10.3.3.8.1 through 10.3.3.8.5.

10.3.3.8.1 Number of sprinklers.
Limited area sprinkler systems shall not exceed six sprinklers in any single fire area.

10.3.3.8.2 Occupancy hazard classification.
Only areas classified by the Ghana Fire Code as Light Hazard or Ordinary Hazard Group 1 shall be permitted to be protected by limited area sprinkler systems.

10.3.3.8.3 Piping arrangement.
Where a limited area sprinkler system is installed in a building with an automatic wet Fire hydrant system, sprinklers shall be supplied by the Fire hydrant system. Where a limited area sprinkler system is installed in a building without an automatic wet Fire hydrant system, water shall be permitted to be supplied by the plumbing system provided that the plumbing system is capable of simultaneously supplying domestic and sprinkler demands.

10.3.3.8.4 Supervision.
Control valves shall not be installed between the water supply and sprinklers unless the
valves are of an approved indicating type that are supervised or secured in the open position.

10.3.3.8.5 Calculations.

Hydraulic calculations in accordance with the Ghana Fire Code shall be provided to demonstrate that the available water flow and pressure are adequate to supply all sprinklers installed in any single fire area with discharge densities corresponding to the hazard classification.

10.3.4 Sprinkler system supervision and alarms.

Valves controlling the water supply for automatic sprinkler systems, pumps, tanks, water levels and temperatures, critical air pressures and waterflow switches on all sprinkler systems shall be electrically supervised by a listed fire alarm control unit.

Exceptions:

1. Automatic sprinkler systems protecting one- and two-family dwellings.
2. Limited area sprinkler systems in accordance with Clause 10.3.3.8.
3. Automatic sprinkler systems installed in accordance with the Ghana Fire Code where a common supply main is used to supply both domestic water and the automatic sprinkler system, and a separate shutoff valve for the automatic sprinkler system is not provided.
4. Jockey pump control valves that are sealed or locked in the open position.
5. Control valves to commercial kitchen hoods, paint spray booths or dip tanks that are sealed or locked in the open position.
6. Valves controlling the fuel supply to fire pump engines that are sealed or locked in the open position.
7. Trim valves to pressure switches in dry, preaction and deluge sprinkler systems that are sealed or locked in the open position.

103.4.1 Monitoring.

Alarm, supervisory and trouble signals shall be distinctly different and shall be automatically transmitted to an approved supervising station or, where approved by the fire Code official, shall sound an audible signal at a constantly attended location.

Exceptions:

1. Underground key or hub valves in roadway boxes provided by the municipality or public utility are not required to be monitored.
2. Backflow prevention device test valves located in limited area sprinkler system supply piping shall be locked in the open position. In occupancies required to be equipped with a fire alarm system, the backflow preventer valves shall be electrically supervised by a tamper switch installed in accordance with ISO 7240 and separately annunciated.

10.3.4.2 Alarms.

An approved audible device, located on the exterior of the building in an approved location, shall be connected to each automatic sprinkler system. Such sprinkler waterflow alarm devices shall be activated by water flow equivalent to the flow of a single sprinkler of the smallest orifice size installed in the system. Where a fire alarm system is installed, actuation of the automatic sprinkler system shall actuate the building fire alarm system.

10.3.4.3 Floor control valves.

Approved supervised indicating control valves shall be provided at the point of connection to the riser on each floor in high-rise buildings.

10.3.5 Testing and maintenance.

Sprinkler systems shall be tested and maintained in accordance with the Ghana Fire Code.

10.4 ALTERNATIVE AUTOMATIC FIRE-EXTINGUISHING SYSTEMS

10.4.1 General.

Automatic fire-extinguishing systems, other than automatic sprinkler systems, shall be designed, installed, inspected, tested and maintained in accordance with the provisions of this clause and the applicable referenced standards.
10.4.2 Where permitted.
Automatic fire-extinguishing systems installed as an alternative to the required automatic sprinkler systems of Clause 10.3 shall be approved by the fire Code official.

10.4.2.1 Restriction on using automatic sprinkler system exceptions or reductions.
Automatic fire-extinguishing systems shall not be considered alternatives for the purposes of exceptions or reductions allowed for automatic sprinkler systems or by other requirements of this Code.

10.4.2.2 Commercial hood and duct systems.
Each required commercial kitchen exhaust hood and duct system required by the Ghana Fire Code to have a Type I hood shall be protected with an approved automatic fire-extinguishing system installed in accordance with this Code.

10.4.3 Installation.
Automatic fire-extinguishing systems shall be installed in accordance with this clause.

10.4.3.1 Electrical wiring.
Electrical wiring shall be in accordance with Ghana Wiring Code.

10.4.3.2 Actuation.
Automatic fire-extinguishing systems shall be automatically actuated and provided with a manual means of actuation in accordance with Clause 10.4.11.1. Where more than one hazard could be simultaneously involved in fire due to their proximity, all hazards shall be protected by a single system designed to protect all hazards that could become involved.

Exception: Multiple systems shall be permitted to be installed if they are designed to operate simultaneously.

10.4.3.3 System interlocking.
Automatic equipment interlocks with fuel shutoffs, ventilation controls, door closers, window shutters, conveyor openings, smoke and heat vents and other features necessary for proper operation of the fire-extinguishing system shall be provided as required by the design and installation standard utilized for the hazard.

10.4.3.4 Alarms and warning signs.
Where alarms are required to indicate the operation of automatic fire-extinguishing systems, distinctive audible and visible alarms and warning signs shall be provided to warn of pending agent discharge. Where exposure to automatic-extinguishing agents poses a hazard to persons and a delay is required to ensure the evacuation of occupants before agent discharge, a separate warning signal shall be provided to alert occupants once agent discharge has begun. Audible signals shall be in accordance with Clause 10.7.5.2.

10.4.3.5 Monitoring.
Where a building fire alarm system is installed, automatic fire-extinguishing systems shall be monitored by the building fire alarm system in accordance with ISO 7240.

10.4.4 Inspection and testing.
Automatic fire-extinguishing systems shall be inspected and tested in accordance with the provisions of this clause prior to acceptance.

10.4.4.1 Inspection.
Prior to conducting final acceptance tests, all of the following items shall be inspected:

1. Hazard specification for consistency with design hazard.
2. Type, location and spacing of automatic- and manual-initiating devices.
3. Size, placement and position of nozzles or discharge orifices.
4. Location and identification of audible and visible alarm devices.
5. Identification of devices with proper designations.
6. Operating instructions.

10.4.4.2 Alarm testing.
Notification appliances, connections to fire alarm systems and connections to approved supervising stations shall be tested in accordance with this clause and Clause 10.7 to verify proper operation.

10.4.4.2.1 Audible and visible signals.
The audibility and visibility of notification appliances signaling agent discharge or system operation, where required, shall be verified.

10.4.4.3 Monitor testing.
Connections to protected premises and supervising station fire alarm systems shall be tested to verify proper identification and retransmission of alarms from automatic fire-extinguishing systems.

10.4.5 Wet-chemical systems.
Wet-chemical extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the Ghana Fire Code and their listing. Records of inspections and testing shall be maintained.

10.4.6 Dry-chemical systems.
Dry-chemical extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the Ghana Fire Code and their listing. Records of inspections and testing shall be maintained.

10.4.7 Foam systems.
Foam-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the Ghana Fire Code and their listing. Records of inspections and testing shall be maintained.

10.4.8 Carbon dioxide systems.
Carbon dioxide extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the Ghana Fire Code and their listing. Records of inspections and testing shall be maintained.

10.4.9 Halon systems.
Halogenated extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the Ghana Fire Code and their listing. Records of inspections and testing shall be maintained.

10.4.10 Clean-agent systems.
Clean-agent fire-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the Ghana Fire Code and their listing. Records of inspections and testing shall be maintained.

10.4.11 Automatic water mist systems.
Automatic water mist systems shall be permitted in applications that are consistent with the applicable listing or approvals and shall comply with Clauses 10.4.11.1 through 10.4.11.3.

10.4.11.1 Design and installation requirements.
Automatic water mist systems shall be designed and installed in accordance with Clauses 10.4.11.1.1 through 10.4.11.1.4.

10.4.11.1.1 General.
Automatic water mist systems shall be designed and installed in accordance with the Ghana Fire Code and the manufacturer’s instructions.

10.4.11.1.2 Actuation.
Automatic water mist systems shall be automatically actuated.

10.4.11.1.3 Water supply protection.
Connections to a potable water supply shall be protected against backflow in accordance with this Code.

10.4.11.1.4 Secondary water supply.
Where a secondary water supply is required for an automatic sprinkler system, an automatic
water mist system shall be provided with an approved secondary water supply.

10.4.11.2 Water mist system supervision and alarms.

Supervision and alarms shall be provided as required for automatic sprinkler systems in accordance with Clause 10.3.4.

10.4.11.2.1 Monitoring.

Monitoring shall be provided as required for automatic sprinkler systems in accordance with Clause 10.3.4.1.

10.4.11.2.2 Alarms.

Alarms shall be provided as required for automatic sprinkler systems in accordance with Clause 10.3.4.2.

10.4.11.2.3 Floor control valves.

Floor control valves shall be provided as required for automatic sprinkler systems in accordance with Clause 10.3.4.3.

10.4.11.3 Testing and maintenance.

Automatic water mist systems shall be tested and maintained in accordance with the Ghana Fire Code.

10.4.12 Commercial cooking systems.

The automatic fire-extinguishing system for commercial cooking systems shall be of a type recognized for protection of commercial cooking equipment and exhaust systems of the type and arrangement protected. Preengineered automatic dry- and wet-chemical extinguishing systems shall be tested in accordance with this Code and listed and labelled for the intended application. Other types of automatic fire-extinguishing systems shall be listed and labelled for specific use as protection for commercial cooking operations. The system shall be installed in accordance with this Code, the Ghana Fire Code, its listing and the manufacturer’s installation instructions. Automatic fire-extinguishing systems of the following types shall be installed in accordance with the referenced standard indicated, as follows:

1. Carbon dioxide extinguishing systems, the Ghana Fire Code

2. Automatic sprinkler systems, the Ghana Fire Code.

3. Automatic water mist systems, the Ghana Fire Code.

4. Foam-water sprinkler system or foam-water spray systems, the Ghana Fire Code.

5. Dry-chemical extinguishing systems, the Ghana Fire Code.

6. Wet-chemical extinguishing systems, the Ghana Fire Code.

Exception: Factory-built commercial cooking recirculating systems that are tested in accordance with this Code and listed, labeled and installed in accordance with this Code.

10.4.12.1 Manual system operation.

A manual actuation device shall be located at or near a means of Escape from the cooking area not less than 3048 mm (10 feet) and not more than 6096 mm (20 feet) from the kitchen exhaust system. The manual actuation device shall be installed not more than 48 inches (1200 mm) or less than 1067 mm (42 inches) above the floor and shall clearly identify the hazard protected. The manual actuation shall require a maximum force of 178 N (40 pounds) and a maximum movement of 356 mm (14 inches) to actuate the fire suppression system.

Exception: Automatic sprinkler systems shall not be required to be equipped with manual actuation means.

10.4.12.2 System interconnection.

The actuation of the fire suppression system shall automatically shut down the fuel or electrical power supply to the cooking equipment. The fuel and electrical supply reset shall be manual.

10.4.12.3 Carbon dioxide systems.

Where carbon dioxide systems are used, there shall be a nozzle at the top of the ventilating duct. Additional nozzles that are symmetrically arranged to give uniform distribution shall be installed within vertical ducts exceeding 20 feet (6096 mm) and horizontal ducts exceeding 15 240 mm (50 feet). Dampers shall be installed at either the top or the bottom of the duct and shall be arranged to operate automatically upon activation of the fire-extinguishing system. Where the damper is installed at the top of the...
duct, the top nozzle shall be immediately below the damper. Automatic carbon dioxide fire-extinguishing systems shall be sufficiently sized to protect against all hazards venting through a common duct simultaneously.

10.4.12.3.1 Ventilation system.

Commercial-type cooking equipment protected by an automatic carbon dioxide-extinguishing system shall be arranged to shut off the ventilation system upon activation.

10.4.12.4 Special provisions for automatic sprinkler systems.

Automatic sprinkler systems protecting commercial-type cooking equipment shall be supplied from a separate, indicating-type control valve that is identified. Access to the control valve shall be provided.

10.4.12.4.1 Listed sprinklers.

Sprinklers used for the protection of fryers shall be tested in accordance with this Code, listed for that application and installed in accordance with their listing.

10.4.13 Domestic cooking systems.

Cooktops and ranges installed in the following occupancies shall be protected in accordance with Clause 10.4.13.1:

1. In Group I-1 occupancies where domestic cooking facilities are installed in accordance with Clause 4.20.8.

2. In Group I-2, Condition 1 occupancies where domestic cooking facilities are installed in accordance with Clause 4.7.2.6.

3. In Group R-2 college dormitories where domestic cooking facilities are installed in accordance with this Code.

10.4.13.1 Protection from fire.

Cooktops and ranges shall be protected in accordance with Clause 10.4.13.1.1 or 10.4.13.1.2.

10.4.13.1.1 Automatic fire-extinguishing system.

The domestic recirculating or exterior vented cooking hood provided over the cooktop or range shall be equipped with an approved automatic fire-extinguishing system complying with the following:

1. The automatic fire-extinguishing system shall be of a type recognized for protection of domestic cooking equipment. Preengineered automatic fire-extinguishing systems shall be listed and labelled in accordance with this Code and installed in accordance with the manufacturer's instructions.

2. Manual actuation of the fire-extinguishing system shall be provided in accordance with Clause 10.4.12.1.

3. Interconnection of the fuel and electric power supply shall be in accordance with Clause 10.4.12.2.

10.4.13.1.2 Ignition prevention.

Cooktops and ranges shall include burners that have been tested and listed to prevent ignition of cooking oil with burners turned on to their maximum heat settings and allowed to operate for 30 minutes.

10.4.14 Aerosol fire-extinguishing systems.

Aerosol fire-extinguishing systems shall be installed, periodically inspected, tested and maintained in accordance with Clauses 10.1 and 10.4.4, the Ghana Fire Code and in accordance with their listing.

Such devices and appurtenances shall be listed and installed in compliance with manufacturer's instructions.

10.5 FIRE HYDRANT SYSTEMS

10.5.1 General.

Fire hydrant systems shall be provided in new buildings and structures in accordance with Clauses 10.5.2 through 10.5.11. In buildings used for high-piled combustible storage, fire protection shall be in accordance with the Ghana Fire Code.

10.5.2 Installation standard.

Fire hydrant systems shall be installed in
accordance with this clause and the Ghana Fire Code. Fire department connections for Fire hydrant systems shall be in accordance with Clause 10.12.

10.5.3 Required installations.
Fire hydrant systems shall be installed where required by Clauses 10.5.3.1 through 10.5.3.8. Fire hydrant systems are allowed to be combined with automatic sprinkler systems.

Exception:
Fire hydrant systems are not required in Group R-3 occupancies.

10.5.3.1 Height.
Class III Fire hydrant systems shall be installed throughout buildings where any of the following conditions exist:

1. Four or more stories are above or below grade plane.
2. The floor level of the highest storey is located more than 9144 mm (30 feet) above the lowest level of fire department vehicle access.
3. The floor level of the lowest storey is located more than 9144 mm (30 feet) below the highest level of fire department vehicle access.

Exceptions:
1. Class I standpipes are allowed in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.
2. Class I standpipes are allowed in Group B and E occupancies.
3. Class I manual standpipes are allowed in open parking garages where the highest floor is located not more than 45 720 mm (150 feet) above the lowest level of fire department vehicle access.
4. Class I manual dry standpipes are allowed in open parking garages that are subject to freezing temperatures, provided that the hose connections are located as required for Class II standpipes in accordance with Clause 10.5.5.
5. Class I standpipes are allowed in basements equipped throughout with an automatic sprinkler system.
6. Class I standpipes are allowed in buildings where occupant-use hose lines will not be utilized by trained personnel or the fire department.
7. In determining the lowest level of fire department vehicle access, it shall not be required to consider either of the following:
   7.1. Recessed loading docks for four vehicles or less.
   7.2. Conditions where topography makes access from the fire department vehicle to the building impractical or impossible.

10.5.3.2 Group A.
Class I automatic wet standpipes shall be provided in nonsprinklered Group A buildings having an occupant load exceeding 1,000 persons.

Exceptions:
1. Open-air-seating spaces without enclosed spaces.
2. Class I automatic dry and semiautomatic dry standpipes or manual wet standpipes are allowed in buildings that are not high-rise buildings.

10.5.3.3 Covered and open mall buildings.
Covered mall and open mall buildings shall be equipped throughout with a Fire hydrant system where required by clause 10.5.3.1. Mall buildings not required to be equipped with a Fire hydrant system by clause 10.5.3.1 shall be equipped with class I hose connections connected to the automatic sprinkler system sized to deliver water at 250 gallons per minute (946.4 l/min) at the hydraulically most remote...
hose connection while concurrently supplying the automatic sprinkler system demand. The Fire hydrantsystem shall be designed to not exceed a 345 kpa (50 pounds per square inch (psi)) residual pressure loss with a flow of 250 gallons per minute (946.4 l/min) from the fire department connection to the hydraulically most remote hose connection. Hose connections shall be provided at each of the following locations:

1. within the mall at the entrance to each exit passageway or corridor.
2. At each floor-level landing within interior exit stairways opening directly on the mall.
3. At exterior public entrances to the mall of a covered mall building.
4. At public entrances at the perimeter line of an open mall building.
5. At other locations as necessary so that the distance to reach all portions of a tenant space does not exceed 60 960 mm (200 feet) from a hose connection.

10.5.3.4 Stages.
Stages greater than 93 m² (1,000 square feet in area) shall be equipped with a Class III wet Fire hydrant system with 38 mm and 64 mm (1 1/2- and 2 1/2-inch) hose connections on each side of the stage.

Exception: Where the building or area is equipped throughout with an automatic sprinkler system, a 38 mm (1 1/2-inch) hose connection shall be installed in accordance with the Ghana Fire Code.

10.5.3.4.1 Hose and cabinet.
The 38 mm (1 1/2-inch) hose connections shall be equipped with sufficient lengths of 38 mm (1 1/2-inch) hose to provide fire protection for the stage area. Hose connections shall be equipped with an approved adjustable fog nozzle and be mounted in a cabinet or on a rack.

10.5.3.5 Underground buildings.
Underground buildings shall be equipped throughout with a Class I automatic wet or manual wet Fire hydrant system.

10.5.3.6 Helistops and heliports.
Buildings with a rooftop helistop or heliport shall be equipped with a Class I or III Fire hydrant system extended to the roof level on which the helistop or heliport is located in accordance with the Ghana Fire Code.

10.5.3.7 Marinas and boatyards.
Standpipes in marinas and boatyards shall comply with the Ghana Fire Code.

10.5.3.8 Rooftop gardens and landscaped roofs.
Buildings or structures that have rooftop gardens or landscaped roofs and that are equipped with a Fire hydrant system shall have the Fire hydrant system extended to the roof level on which the rooftop garden or landscaped roof is located.

10.5.4 Location of Class I Fire hydrant hose connections.
Class I Fire hydrant hose connections shall be provided in all of the following locations:

1. In every required interior exit stairway, a hose connection shall be provided for each storey above and below grade plane. Hose connections shall be located at the main floor landing unless otherwise approved by the fire Code official.

   Exception: A single hose connection shall be permitted to be installed in the open corridor or open breezeway between open stairs that are not greater than 22 860 mm (75 feet) apart.

2. On each side of the wall adjacent to the exit opening of a horizontal exit.

   Exception: Where floor areas adjacent to a horizontal exit are reachable from an interior exit stairway hose connection by a 9144 mm (30-foot) hose stream from a nozzle attached to 30 480 mm (100 feet) of hose, a hose connection shall not be required at the horizontal exit.
3. In every exit passageway, at the entrance from the exit passageway to other areas of a building.

**Exception:** Where floor areas adjacent to an exit passageway are reachable from an interior exit stairway hose connection by a 9144 mm (30-foot) hose stream from a nozzle attached to 30 480 mm (100 feet) of hose, a hose connection shall not be required at the entrance from the exit passageway to other areas of the building.

4. In covered mall buildings, adjacent to each exterior public entrance to the mall and adjacent to each entrance from an exit passageway or exit corridor to the mall. In open mall buildings, adjacent to each public entrance to the mall at the perimeter line and adjacent to each entrance from an exit passageway or exit corridor to the mall.

5. Where the roof has a slope less than four units vertical in 12 units horizontal (33.3-percent slope), a hose connection shall be located to serve the roof or at the highest landing of an interior exit stairway with access to the roof provided in accordance with Clause 11.11.12.

6. Where the most remote portion of a nonsprinklered floor or storey is more than 45 720 mm (150 feet) from a hose connection or the most remote portion of a sprinklered floor or storey is more than 60 960 mm (200 feet) from a hose connection, the fire Code official is authorized to require that additional hose connections be provided in approved locations.

**10.5.4.1 Protection.**
Risers and laterals of Class I Fire hydrant systems not located within an interior exit stairway shall be protected by a degree of fire resistance equal to that required for vertical enclosures in the building in which they are located.

**Exception:** In buildings equipped throughout with an approved automatic sprinkler system, laterals that are not located within an interior exit stairway are not required to be enclosed within fire-resistance-rated construction.

**10.5.4.2 Interconnection.**
In buildings where more than one Fire hydrant provided, the standpipes shall be interconnected in accordance with the Ghana Fire Code.

**10.5.5 Location of Class II Fire hydrant hose connections.**
Class II Fire hydrant hose connections located so that all portions of the building are within 9144 mm (30 feet) of a nozzle attached to 30 480 mm (100 feet) of hose. Class II Fire hydrant hose connections shall be located where they will have ready access.

**10.5.5.1 Groups A-1 and A-2.**
In Group A-1 and A-2 occupancies having occupant loads exceeding 1,000 persons, hose connections shall be located on each side of any stage, on each side of the rear of the auditorium, on each side of the balcony and on each tier of dressing rooms.

**10.5.5.2 Protection.**
Fire-resistance-rated protection of risers and laterals of Class II Fire hydrant systems is not required.

**10.5.5.3 Class II system 1-inch hose.**
A minimum 25 mm (1-inch) hose shall be allowed to be used for hose stations in light-hazard occupancies where investigated and listed for this service and where approved by the fire Code official.

**10.5.6 Location of Class III Fire hydrant hose connections.**
Class III Fire hydrant systems shall have hose connections located as required for Class I standpipes in Clause 10.5.4 and shall have Class II hose connections as required in Clause 10.5.5.

**10.5.6.1 Protection.**
Risers and laterals of Class III Fire hydrant systems shall be protected as required for Class I systems in accordance with Clause 10.5.4.1.

**10.5.6.2 Interconnection.**
In buildings where more than one Class III Fire hydrant provided, the standpipes shall be interconnected in accordance with the Ghana Fire Code.

**10.5.7 Cabinets.**
Cabinets containing fire-fighting equipment such as standpipes, fire hoses, fire extinguishers or fire department valves shall not be blocked from use or obscured from view.
10.5.7.1 Cabinet equipment identification. Cabinets shall be identified in an approved manner by a permanently attached sign with letters not less than 51 mm (2 inches) high in a color that contrasts with the background color, indicating the equipment contained therein.

Exceptions:
1. Doors not large enough to accommodate a written sign shall be marked with a permanently attached pictogram of the equipment contained therein.
2. Doors that have either an approved visual identification clear glass panel or a complete glass door panel are not required to be marked.

10.5.7.2 Locking cabinet doors. Cabinets shall be unlocked.

Exceptions:
1. Visual identification panels of glass or other approved transparent frangible material that is easily broken and allows access.
2. Approved locking arrangements.
3. Group I-3 occupancies.

10.5.8 Dry standpipes. Dry standpipes shall not be installed.

Exception: Where subject to freezing and in accordance with the Ghana Fire Code

10.5.9 Valve supervision. Valves controlling water supplies shall be supervised in the open position so that a change in the normal position of the valve will generate a supervisory signal at the supervising station required by Clause 10.3.4. Where a fire alarm system is provided, a signal shall be transmitted to the control unit.

Exceptions:
1. Valves to underground key or hub valves in roadway boxes provided by the municipality or public utility do not require supervision.
2. Valves locked in the normal position and inspected as provided in this Code in buildings not equipped with a fire alarm system.

10.5.10 During construction. Fire hydrant systems required during construction and demolition operations shall be provided in accordance with Clause 3311.

10.5.11 Locking Fire hydrant outlet caps. The fire Code official is authorized to require locking caps on the outlets on dry standpipes where the responding fire department carries key wrenches for the removal that are compatible with locking FDC connection caps.

10.6 PORTABLE FIRE EXTINGUISHERS

10.6.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

1. In Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exceptions:
1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
2. Within 9144 mm (30 feet) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3
occupancies, in accordance with the Ghana Fire Code.

5. Where required by the Ghana Fire Code clauses indicated in Table 10.6.1.

6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the fire Code official.

### 10.6.2 General requirements.
Portable fire extinguishers shall be selected and installed in accordance with this clause and the Ghana Fire Code.

**Exceptions:**

1. The distance of travel to reach an extinguisher shall not apply to the spectator seating portions of Group A-5 occupancies.

2. In Group I-3, portable fire extinguishers shall be permitted to be located at staff locations.

### 10.6.3 Size and distribution.
The size and distribution of portable fire extinguishers shall be in accordance with Clauses 10.6.3.1 through 10.6.3.4

### TABLE 10.6.3(1) FIRE EXTINGUISHERS FOR CLASS A FIRE HAZARDS

Note: For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m², 1 gallon = 3.785 L.
a. Two 2 1/2-gallon water-type extinguishers shall be deemed the equivalent of one 4-A rated extinguisher.

b. Annex E.3.3 of the Ghana Fire Code provides more details concerning application of the maximum floor area criteria.

c. Two water-type extinguishers each with a 1-A rating shall be deemed the equivalent of one 2-A rated extinguisher for Light (Low) Hazard Occupancies

</table>

**Note:** For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. For requirements on water-soluble flammable liquids and alternative sizing criteria, see Clause 5.5 of NFPA 10.

### 10.6.3.1 Class A fire hazards.
The minimum sizes and distribution of portable fire extinguishers for occupancies that involve primarily Class A fire hazards shall comply with Table 10.6.3(1).

### 10.6.3.2 Class B fire hazards.
Portable fire extinguishers for occupancies involving flammable or combustible liquids with depths less than or equal to 6.4 mm (0.25-inch) shall be selected and placed in accordance with Table 10.6.3(2).

Portable fire extinguishers for occupancies involving flammable or combustible liquids with a depth of greater than 6.4 mm (0.25-inch) shall be selected and placed in accordance with the Ghana Fire Code.

### 10.6.3.3 Class C fire hazards.
Portable fire extinguishers for Class C fire hazards shall be selected and placed on the basis of the anticipated Class A or B hazard.

### 10.6.3.4 Class D fire hazards.
Portable fire extinguishers for occupancies involving combustible metals shall be selected and placed in accordance with the Ghana Fire Code.

### 10.6.4 Cooking equipment fires.
Fire extinguishers provided for the protection of cooking equipment shall be of an approved type compatible with the automatic fire-extinguishing system agent. Cooking equipment involving solid fuels or vegetable or animal oils and fats shall be protected by a Class K-rated portable extinguisher in accordance with Clauses 10.6.1, Item 2, 10.6.4.1 and 10.6.4.2 of the Ghana Fire Code, as applicable.

### 10.6.5 Conspicuous location.
Portable fire extinguishers shall be located in conspicuous locations where they will have ready access and be immediately available for use. These locations shall be along normal paths of travel, unless the fire Code official determines that the hazard posed indicates the need for placement away from normal paths of travel.

### 10.6.6 Unobstructed and unobscured.
Portable fire extinguishers shall not be obstructed or obscured from view. In rooms or areas in which visual obstruction cannot be completely avoided, means shall be provided to indicate the locations of extinguishers.

### 10.6.7 Hangers and brackets.
Hand-held portable fire extinguishers, not housed in cabinets, shall be installed on the hangers or brackets supplied. Hangers or brackets shall be securely anchored to the mounting surface in accordance with the manufacturer’s installation instructions.

### 10.6.8 Cabinets.
Cabinets used to house portable fire extinguishers shall not be locked.

**Exceptions:**

1. Where portable fire extinguishers subject to malicious use or damage
are provided with a means of ready access.

2. In Group I-3 occupancies and in mental health areas in Group I-2 occupancies, access to portable fire extinguishers shall be permitted to be locked or to be located in staff locations provided that the staff has keys.

10.6.9 Extinguisher installation.
The installation of portable fire extinguishers shall be in accordance with Clauses 10.6.9.1 through 10.6.9.3.

10.6.9.1 Extinguishers weighing 40 pounds or less.
Portable fire extinguishers having a gross weight not exceeding 18 kg (40 pounds) shall be installed so that their tops are not more than 1524 mm (5 feet) above the floor.

10.6.9.2 Extinguishers weighing more than 40 pounds.
Hand-held portable fire extinguishers having a gross weight exceeding 18 kg (40 pounds) shall be installed so that their tops are not more than 1067 mm (3.5 feet) above the floor.

10.6.9.3 Floor clearance.
The clearance between the floor and the bottom of installed hand-held portable fire extinguishers shall be not less than 102 mm (4 inches).

10.6.10 Wheeled units.
Wheeled fire extinguishers shall be conspicuously located in a designated location.

10.7 FIRE ALARM AND DETECTION SYSTEMS

10.7.1 General.
This clause covers the application, installation, performance and maintenance of fire alarm systems and their components.

10.7.1.1 Construction documents.
Construction documents for fire alarm systems shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this Code, the Ghana Fire Code and relevant IEN 310, rules and regulations, as determined by the fire Code official.

10.7.1.2 Fire alarm shop drawings.
Fire plan and shop drawings for fire alarm systems shall be prepared in accordance with ISO 7240 and submitted for review and approval prior to system installation.

10.7.1.3 Equipment.
Systems and components shall be listed and approved for the purpose for which they are installed.

10.7.2 Where required—new buildings and structures.
An approved fire alarm system installed in accordance with the provisions of this Code and ISO 7240 shall be provided in new buildings and structures in accordance with Clauses 10.7.2.1 through 10.7.2.23 and provide occupant notification in accordance with Clause 10.7.5, unless other requirements are provided by another clause of this Code.

Not less than one manual fire alarm box shall be provided in an approved location to initiate a fire alarm signal for fire alarm systems employing automatic fire detectors or waterflow detection devices. Where other clauses of this Code allow elimination of fire alarm boxes due to sprinklers, a single fire alarm box shall be installed.

Exceptions:

1. The manual fire alarm box is not required for fire alarm systems dedicated to elevator recall control and supervisory service.

2. The manual fire alarm box is not required for Group R-2 occupancies unless required by the fire Code official to provide a means for fire watch personnel to initiate an alarm during a sprinkler system impairment event. Where provided, the manual fire alarm box shall not be located in an area that is open to the public.

10.7.2.1 Group A.
A manual fire alarm system that activates the occupant notification system in accordance with Clause 10.7.5 shall be installed in Group A occupancies where the occupant load due to the assembly occupancy is 300 or more, or where the Group A occupant load is more than
100 persons above or below the lowest level of exit discharge. Group A occupancies not separated from one another in accordance with Clause 8.7.3.10 shall be considered as a single occupancy for the purposes of applying this clause. Portions of Group E occupancies occupied for assembly purposes shall be provided with a fire alarm system as required for the Group E occupancy.

Exception: Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

10.7.2.1 System initiation in Group A occupancies with an occupant load of 1,000 or more.
Activation of the fire alarm in Group A occupancies with an occupant load of 1,000 or more shall initiate a signal using an emergency voice/alarm communications system in accordance with Clause 10.7.5.2.2.

Exception: Where approved, the prerecorded announcement is allowed to be manually deactivated for a period of time, not to exceed 3 minutes, for the sole purpose of allowing a live voice announcement from an approved, constantly attended location.

10.7.2.2 Group B.
A manual fire alarm system shall be installed in Group B occupancies where one of the following conditions exists:

1. The combined Group B occupant load of all floors is 500 or more.
2. The Group B occupant load is more than 100 persons above or below the lowest level of exit discharge.
3. The fire area contains an ambulatory care facility.

Exception: Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

10.7.2.2.1 Ambulatory care facilities.
Fire areas containing ambulatory care facilities shall be provided with an electronically supervised automatic smoke detection system installed within the ambulatory care facility and in public use areas outside of tenant spaces, including public corridors and elevator lobbies.

Exception: Buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, provided that the occupant notification appliances will activate throughout the notification zones upon sprinkler waterflow.

10.7.2.3 Group E.
A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Clause 10.7.5.2.2 and installed in accordance with Clause 10.7.6 shall be installed in Group E occupancies. Where automatic sprinkler systems or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an occupant load of 50 or less.
2. Emergency voice/alarm communication systems meeting the requirements of Clause 10.7.5.2.2 and installed in accordance with Clause 10.7.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual fire alarm system initiates an approved occupant notification signal in accordance with Clause 10.7.5.
3. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
3.1. Interior corridors are protected by smoke detectors.

3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by heat detectors or other approved detection devices.

3.3. Shops and laboratories involving dusts or vapours are protected by heat detectors or other approved detection devices.

4. Manual fire alarm boxes shall not be required in Group E occupancies where all of the following apply:

4.1. The building is equipped throughout with an approved automatic sprinkler system installed in accordance with Clause 10.3.3.1.1.

4.2. The emergency voice/alarm communication system will activate on sprinkler waterflow.

4.3. Manual activation is provided from a normally occupied location.

10.7.2.4 Group F.
A manual fire alarm system that activates the occupant notification system in accordance with Clause 10.7.5 shall be installed in Group F occupancies where both of the following conditions exist:

1. The Group F occupancy is two or more stories in height.

2. The Group F occupancy has a combined occupant load of 500 or more above or below the lowest level of exit discharge.

Exception: Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

10.7.2.5 Group H.
A manual fire alarm system that activates the occupant notification system in accordance with Clause 10.7.5 shall be installed in Group H-5 occupancies and in occupancies used for the manufacture of organic coatings. An automatic smoke detection system shall be installed for highly toxic gases, organic peroxides and oxidizers in accordance with Parts 60, 62 and 63, respectively, of the Ghana Fire Code.

10.7.2.6 Group I.
A manual fire alarm system that activates the occupant notification system in accordance with Clause 10.7.5 shall be installed in Group I-5 occupancies and in occupancies used for the manufacture of organic coatings. An automatic smoke detection system that activates the occupant notification system in accordance with Clause 907.5 shall be provided in accordance with Clauses 10.7.2.6.1, 10.7.2.6.2 and 10.7.2.6.3.3.

Exceptions:

1. Manual fire alarm boxes in sleeping units of Group I-1 and I-2 occupancies shall not be required at exits if located at all care providers’ control stations or other constantly attended staff locations, provided that such manual fire alarm boxes are visible and provided with ready access, and the distances of travel required in Clause 10.7.4.2.1 are not exceeded.

2. Occupant notification systems are not required to be activated where private mode signaling installed in accordance with ISO 7240 is approved by the fire Code official and staff evacuation responsibilities are included in the fire safety and evacuation plan required by the Ghana Fire Code.
10.7.2.6.1 Group I-1.
In Group I-1 occupancies, an automatic smoke detection system shall be installed in corridors, waiting areas open to corridors and habitable spaces other than sleeping units and kitchens. The system shall be activated in accordance with Clause 10.7.5.

Exceptions:

1. For Group I-1, Condition 1 occupancies, smoke detection in habitable spaces is not required where the facility is equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1.

2. Smoke detection is not required for exterior balconies.

10.7.2.6.1.1 Smoke alarms.
Single- and multiple-station smoke alarms shall be installed in accordance with Clause 10.7.2.11.

10.7.2.6.2 Group I-2.
An automatic smoke detection system shall be installed in corridors in Group I-2, Condition 1 facilities and spaces permitted to be open to the corridors by Clause 407.2. The system shall be activated in accordance with Clause 10.7.4. Group I-2, Condition 2 occupancies shall be equipped with an automatic smoke detection system as required in Clause 407.

Exceptions:

1. Corridor smoke detection is not required in smoke compartments that contain sleeping units where sleeping unit doors are equipped with automatic door-closing devices with integral smoke detectors on the unit sides installed in accordance with their listing, provided that the integral detectors perform the required alerting function.

10.7.2.6.3 Group I-3 occupancies.
Group I-3 occupancies shall be equipped with a manual fire alarm system and automatic smoke detection system installed for alerting staff.

10.7.2.6.3.1 System initiation.
Actuation of an automatic fire-extinguishing system, automatic sprinkler system, a manual fire alarm box or a fire detector shall initiate an approved fire alarm signal that automatically notifies staff.

10.7.2.6.3.2 Manual fire alarm boxes.
Manual fire alarm boxes are not required to be located in accordance with Clause 10.7.4.2 where the fire alarm boxes are provided at staff-attended locations having direct supervision over areas where manual fire alarm boxes have been omitted.

10.7.2.6.3.2.1 Manual fire alarm boxes in detainee areas.
Manual fire alarm boxes are allowed to be locked in areas occupied by detainees, provided that staff members are present within the subject area and have keys readily available to operate the manual fire alarm boxes.

10.7.2.6.3.3 Automatic smoke detection system.
An automatic smoke detection system shall be installed throughout resident housing areas, including sleeping units and contiguous day rooms, group activity spaces and other common spaces normally open to residents.

Exceptions:

1. Other approved smoke detection arrangements providing equivalent protection, including, but not limited to, placing detectors in exhaust ducts from
cells or behind protective guards listed for the purpose, are allowed where necessary to prevent damage or tampering.

2. Sleeping units in Use Conditions 2 and 3 as described in this Code.

3. Smoke detectors are not required in sleeping units with four or fewer occupants in smoke compartments that are equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1.

### 10.7.2.7 Group M.
A manual fire alarm system that activates the occupant notification system in accordance with Clause 10.7.5 shall be installed in Group M occupancies where one of the following conditions exists:

1. The combined Group M occupant load of all floors is 500 or more persons.

2. The Group M occupant load is more than 100 persons above or below the lowest level of exit discharge.

**Exceptions:**

1. A manual fire alarm system is not required in covered or open mall buildings complying with Clause 4.2.

2. Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 and the occupant notification appliances will automatically activate throughout the notification zones upon sprinkler water flow.

### 10.7.2.7.1 Occupant notification.
During times that the building is occupied, the initiation of a signal from a manual fire alarm box or from a water flow switch shall not be required to activate the alarm notification appliances when an alarm signal is activated at a constantly attended location from which evacuation instructions shall be initiated over an emergency voice/alarm communication system installed in accordance with Clause 10.7.5.2.2.

### 10.7.2.8 Group R-1.
Fire alarm systems and smoke alarms shall be installed in Group R-1 occupancies as required in Clauses 10.7.2.8.1 through 10.7.2.8.3.

#### 10.7.2.8.1 Manual fire alarm system.
A manual fire alarm system that activates the occupant notification system in accordance with Clause 10.7.5 shall be installed in Group R-1 occupancies.

**Exceptions:**

1. A manual fire alarm system is not required in buildings not more than two stories in height where all individual sleeping units and contiguous attic and crawl spaces to those units are separated from each other and public or common areas by not less than 1-hour fire partitions and each individual sleeping unit has an exit directly to a public way, escape court or yard.

2. Manual fire alarm boxes are not required throughout the building where all of the following conditions are met:

   2.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

   2.2. The notification appliances will activate upon sprinkler water flow.
2.3. Not less than one manual fire alarm box is installed at an approved location.

10.7.2.8.2 Automatic smoke detection system.
An automatic smoke detection system that activates the occupant notification system in accordance with Clause 10.7.5 shall be installed throughout all interior corridors serving sleeping units.

Exception: An automatic smoke detection system is not required in buildings that do not have interior corridors serving sleeping units and where each sleeping unit has a means of Escape door opening directly to an exit or to an exterior exit access that leads directly to an exit.

10.7.2.8.3 Smoke alarms.
Single- and multiple-station smoke alarms shall be installed in accordance with Clause 10.7.2.10.

10.7.2.9 Group R-2.
Fire alarm systems and smoke alarms shall be installed in Group R-2 occupancies as required in Clauses 10.7.2.9.1 through 10.7.2.9.3.

10.7.2.9.1 Manual fire alarm system.
A manual fire alarm system that activates the occupant notification system in accordance with Clause 907.5 shall be installed in Group R-2 occupancies where any of the following conditions apply:

1. Any dwelling unit or sleeping unit is located three or more stories above the lowest level of exit discharge.
2. Any dwelling unit or sleeping unit is located more than one storey below the highest level of exit discharge of exits serving the dwelling unit or sleeping unit.
3. The building contains more than 16 dwelling units or sleeping units.

Exceptions:

1. A fire alarm system is not required in buildings not more than two stories in height where all dwelling units or sleeping units and contiguous attic and crawl spaces are separated from each other and public or common areas by not less than 1-hour fire partitions and each dwelling unit or sleeping unit has an exit directly to a public way, Escape court or yard.

2. Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 and the occupant notification appliances will automatically activate throughout the notification zones upon a sprinkler water flow.

3. A fire alarm system is not required in buildings that do not have interior corridors serving dwelling units and are protected by an approved automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2, provided that dwelling units either have a means of Escape door opening directly to an exterior exit access that leads directly to the exits or are served by open-ended corridors designed in accordance with Clause 11.27.6, Exception 3.

10.7.2.9.2 Smoke alarms.
Single- and multiple-station smoke alarms shall be installed in accordance with Clause 10.7.2.10.

10.7.2.9.3 Group R-2 college and university buildings.
An automatic smoke detection system that activates the occupant notification system in accordance with Clause 10.7.5 shall be installed in Group R-2 occupancies operated by a college or university for student or staff housing in all of the following locations:
1. Common spaces outside of dwelling units and sleeping units.
2. Laundry rooms, mechanical equipment rooms and storage rooms.
3. All interior corridors serving sleeping units or dwelling units.

Exception: An automatic smoke detection system is not required in buildings that do not have interior corridors serving sleeping units or dwelling units and where each sleeping unit or dwelling unit either has a means of escape door opening directly to an exterior exit access that leads directly to an exit or a means of Escape door opening directly to an exit.

Required smoke alarms in dwelling units and sleeping units in Group R-2 occupancies operated by a college or university for student or staff housing shall be interconnected with the fire alarm system in accordance with ISO 7240.

10.7.2.10 Single- and multiple-station smoke alarms.
Listed single- and multiple-station smoke alarms complying with this Code shall be installed in accordance with Clauses 10.7.2.10.1 through 10.7.2.10.7 and ISO 7240.

10.7.2.10.1 Group R-1.
Single- or multiple-station smoke alarms shall be installed in all of the following locations in Group R-1:

1. In sleeping areas.
2. In every room in the path of the means of escape from the sleeping area to the door leading from the sleeping unit.
3. In each storey within the sleeping unit, including basements. For sleeping units with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full storey below the upper level.

10.7.2.10.2 Groups R-2, R-3, R-4 and I-1.
Single-or multiple-station smoke alarms shall be installed and maintained in Groups R-2, R-3, R-4 and I-1 regardless of occupant load at all of the following locations:

1. On the ceiling or wall outside of each separate sleeping area in the immediate vicinity of bedrooms.
2. In each room used for sleeping purposes.
3. In each storey within a dwelling unit, including basements but not including crawl spaces and uninhabitable attics. In dwellings or dwelling units with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full storey below the upper level.

10.7.2.10.3 Installation near cooking appliances.
Smoke alarms shall not be installed in the following locations unless this would prevent placement of a smoke alarm in a location required by Clause 10.7.2.10.1 or 10.7.2.10.2:

1. Ionization smoke alarms shall not be installed less than 6096 mm (20 feet) horizontally from a permanently installed cooking appliance.
2. Ionization smoke alarms with an alarm-silencing switch shall not be installed less than 3048 mm (10 feet) horizontally from a permanently installed cooking appliance.
3. Photoelectric smoke alarms shall not be installed less than 1829 mm (6 feet) horizontally from a permanently installed cooking appliance.

10.7.2.10.4 Installation near bathrooms.
Smoke alarms shall be installed not less than 914 mm (3 feet) horizontally from the door or opening of a bathroom that contains a bathtub or shower unless this would prevent placement of a smoke alarm required by Clause 10.7.2.10.1 or 10.7.2.10.2.
10.7.2.10.5 Interconnection.

Where more than one smoke alarm is required to be installed within an individual dwelling unit or sleeping unit in Group R or I-1 occupancies, the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. Physical interconnection of smoke alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation of one alarm. The alarm shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.

10.7.2.10.6 Power source.

In new construction, required smoke alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source and shall be equipped with a battery backup. Smoke alarms with integral strobes that are not equipped with battery backup shall be connected to an emergency electrical system in accordance with Clause 28.13. Smoke alarms shall emit a signal when the batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for overcurrent protection.

Exception: Smoke alarms are not required to be equipped with battery backup where they are connected to an emergency electrical system that complies with Clause 28.13.

10.7.2.10.7 Smoke detection system.

Smoke detectors listed in accordance with this Code and provided as part of the building fire alarm system shall be an acceptable alternative to single- and multiple-station smoke alarms and shall comply with the following:

1. The fire alarm system shall comply with all applicable requirements in Clause 10.7.

2. Activation of a smoke detector in a dwelling unit or sleeping unit shall initiate alarm notification in the dwelling unit or sleeping unit in accordance with Clause 10.7.5.2.

3. Activation of a smoke detector in a dwelling unit or sleeping unit shall not activate alarm notification appliances outside of the dwelling unit or sleeping unit, provided that a supervisory signal is generated and monitored in accordance with Clause 10.7.6.6.

10.7.2.11 Special amusement buildings.

An automatic smoke detection system shall be provided in special amusement buildings in accordance with Clauses 10.7.2.11.1 through 10.7.2.11.3.

10.7.2.11.1 Alarm.

Activation of any single smoke detector, the automatic sprinkler system or any other automatic fire detection device shall immediately activate an audible and visible alarm at the building at a constantly attended location from which emergency action can be initiated, including the capability of manual initiation of requirements in Clause 10.7.2.11.2.

10.7.2.11.2 System response.

The activation of two or more smoke detectors, a single smoke detector equipped with an alarm verification feature, the automatic sprinkler system or other approved fire detection device shall automatically do all of the following:

1. Cause illumination of the means of escape with light of not less than 1 footcandle (11 lux) at the walking surface level.

2. Stop any conflicting or confusing sounds and visual distractions.

3. Activate an approved directional exit marking that will become apparent in an emergency.

4. Activate a prerecorded message, audible throughout the special amusement building, instructing patrons to proceed to the nearest exit. Alarm signals used in conjunction with the prerecorded message shall produce a sound that is distinctive from other sounds used during normal operation.
10.7.2.11.3 Emergency voice/alarm communication system.

An emergency voice/alarm communication system, which is allowed to serve as a public address system, shall be installed in accordance with Clause 10.7.5.2.2 and be audible throughout the entire special amusement building.

10.7.2.12 High-rise buildings.

High-rise buildings shall be provided with an automatic smoke detection system in accordance with Clause 10.7.2.12.1, a fire department communication system in accordance with Clause 10.7.2.12.2 and an emergency voice/alarm communication system in accordance with Clause 10.7.5.2.2.

Exceptions:

1. Airport traffic control towers in accordance with Clauses 4.12 and 10.7.2.21.
2. Open parking garages in accordance with Clause 4.6.5.
4. Low-hazard special occupancies in accordance with Clause 6.3.1.1.
5. Buildings with an occupancy in Group H-1, H-2 or H-3 in accordance with Clause 415.
6. In Group I-1 and I-2 occupancies, the alarm shall sound at a constantly attended location and occupant notification shall be broadcast by the emergency voice/alarm communication system.

10.7.2.12.1 Automatic smoke detection.

Automatic smoke detection in high-rise buildings shall be in accordance with Clauses 10.7.2.12.1.1 and 10.7.2.12.1.2.

10.7.2.12.1.1 Area smoke detection.

Area smoke detectors shall be provided in accordance with this clause. Smoke detectors shall be connected to an automatic fire alarm system. The activation of any detector required by this clause shall activate the emergency voice/alarm communication system in accordance with Clause 10.7.5.2.2. In addition to smoke detectors required by Clauses 10.7.2.1 through 10.7.2.9, smoke detectors shall be located as follows:

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room that is not provided with sprinkler protection.
2. In each elevator machine room, machinery space, control room and control space and in elevator lobbies.

10.7.2.12.1.2 Duct smoke detection.

Duct smoke detectors complying with Clause 10.7.3.1 shall be located as follows:

1. In the main return air and exhaust air plenum of each air-conditioning system having a capacity greater than 2,000 cubic feet per minute (cfm) (0.94 m³/s). Such detectors shall be located in a serviceable area downstream of the last duct inlet.
2. At each connection to a vertical duct or riser serving two or more stories from a return air duct or plenum of an air-conditioning system. In Group R-1 and R-2 occupancies, a smoke detector is allowed to be used in each return air riser carrying not more than 2.4 m³/s (5,000 cfm) and serving not more than 10 air-inlet openings.

10.7.2.12.2 Fire department communication system.

Where a wired communication system is approved in lieu of an emergency responder radio coverage system in accordance with the Ghana Fire Code, the wired fire department communication system shall be designed and
installed in accordance with ISO 7240 and shall operate between a fire command center complying with Clause 911, elevators, elevator lobbies, emergency and standby power rooms, fire pump rooms, areas of refuge and inside interior exit stairways. The fire department communication device shall be provided at each floor level within the interior exit stairway.

10.7.2.12.3 Multiple-channel voice evacuation.
In buildings with an occupied floor more than 36 576 mm (120 feet) above the lowest level of fire department vehicle access, voice evacuation systems for high-rise buildings shall be multiple-channel systems.

10.7.2.13 Atriums connecting more than two stories.
A fire alarm system shall be installed in occupancies with an atrium that connects more than two stories, with smoke detection installed in locations required by a rational analysis in Clause 10.9.4 and in accordance with the system operation requirements in Clause 10.9.17. The system shall be activated in accordance with Clause 10.7.5. Such occupancies in Group A, E or M shall be provided with an emergency voice/alarm communication system complying with the requirements of Clause 10.7.5.2.2.

10.7.2.14 High-piled combustible storage areas.
An automatic smoke detection system shall be installed throughout high-piled combustible storage areas where required by the Ghana Fire Code.

10.7.2.15 Aerosol storage uses.
Aerosol product rooms and general-purpose warehouses containing aerosol products shall be provided with an approved manual fire alarm system where required by the Ghana Fire Code.

10.7.2.16 Timber, wood structural panel and veneer mills.
Timber, wood structural panel and veneer mills shall be provided with a manual fire alarm system.

10.7.2.17 Underground buildings with smoke control systems.
Where a smoke control system is installed in an underground building in accordance with this Code, automatic smoke detectors shall be provided in accordance with Clause 10.7.2.17.1.

10.7.2.17.1 Smoke detectors.
Not less than one smoke detector listed for the intended purpose shall be installed in all of the following areas:

1. Mechanical equipment, electrical, transformer, telephone equipment, elevator machine or similar rooms.
2. Elevator lobbies.
3. The main return and exhaust air plenum of each air-conditioning system serving more than one storey and located in a serviceable area downstream of the last duct inlet.
4. Each connection to a vertical duct or riser serving two or more floors from return air ducts or plenums of heating, ventilating and air-conditioning systems, except that in Group R occupancies, a listed smoke detector is allowed to be used in each return air riser carrying not more than 2.4 m³/s (5,000 cfm) and serving not more than 10 air-inlet openings.

10.7.2.17.2 Alarm required.
Activation of the smoke control system shall activate an audible alarm at a constantly attended location.

10.7.2.18 Deep underground buildings.
Where the lowest level of a structure is more than 18 288 mm (60 feet) below the finished floor of the lowest level of exit discharge, the structure shall be equipped throughout with a manual fire alarm system, including an emergency voice/alarm communication system installed in accordance with Clause 10.7.5.2.2.

10.7.2.19 Covered and open mall buildings.
Where the total floor area exceeds 4645 m² (50,000 square feet) within either a covered mall building or within the perimeter line of an open mall building, an emergency voice/alarm communication system shall be provided. Access to emergency voice/alarm communication systems serving a mall, required or otherwise, shall be provided for the fire department. The system shall be provided in accordance with Clause 10.7.5.2.2.

10.7.2.20 Residential aircraft hangars.
Not fewer than one single-station smoke alarm
shall be installed within a residential aircraft hangar as defined in Part 2 and shall be interconnected into the residential smoke alarm or other sounding device to provide an alarm that will be audible in all sleeping areas of the dwelling.

10.7.2.21 Airport traffic control towers. An automatic smoke detection system that activates the occupant notification system in accordance with Clause 907.5 shall be provided in airport control towers in accordance with Clauses 10.7.2.21.1 and 10.7.2.21.2.

**Exception:** Audible appliances shall not be installed within the control tower cab.

10.7.2.21.1 Airport traffic control towers with multiple exits and automatic sprinklers. Airport traffic control towers with multiple exits and equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 shall be provided with smoke detectors in all of the following locations:

1. Airport traffic control cab.
2. Electrical and mechanical equipment rooms.
3. Airport terminal radar and electronics rooms.
4. Outside each opening into interior exit stairways.
5. Along the single means of Escape permitted from observation levels.
6. Outside each opening into the single means of Escape permitted from observation levels.

10.7.2.21.2 Other airport traffic control towers. Airport traffic control towers with a single exit or where sprinklers are not installed throughout shall be provided with smoke detectors in all of the following locations:

1. Airport traffic control cab.
2. Electrical and mechanical equipment rooms.
3. Airport terminal radar and electronics rooms.
4. Office spaces incidental to the tower operation.
5. Lounges for employees, including sanitary facilities.
7. Utility shafts where access to smoke detectors can be provided.

10.7.2.22 Battery rooms. An automatic smoke detection system shall be installed in areas containing stationary storage battery systems as required in the Ghana Fire Code.

10.7.2.23 Capacitor energy storage systems. An automatic smoke detection system shall be installed in areas containing capacitor energy storage systems as required by this Code.

10.7.3 Fire safety functions. Automatic fire detectors utilized for the purpose of performing fire safety functions shall be connected to the building’s fire alarm control unit where a fire alarm system is required by Clause 10.7.2. Detectors shall, upon actuation, perform the intended function and activate the alarm notification appliances or activate a visible and audible supervisory signal at a constantly attended location. In buildings not equipped with a fire alarm system, the automatic fire detector shall be powered by normal electrical service and, upon actuation, perform the intended function. The detectors shall be located in accordance with ISO 7240.

10.7.3.1 Duct smoke detectors. Smoke detectors installed in ducts shall be listed for the air velocity, temperature and humidity present in the duct. Duct smoke detectors shall be connected to the building’s fire alarm control unit where a fire alarm system is required by Clause 10.7.2. Activation of a duct smoke detector shall initiate a visible and audible supervisory signal at a constantly attended location and shall perform the intended fire safety function in accordance with this Code. In facilities that are required to be monitored by a supervising station, duct smoke detectors shall report only as a supervisory signal and not as a fire alarm. They shall not be used as a substitute for required open area detection.

**Exceptions:**
1. The supervisory signal at a constantly attended location is not required where duct smoke detectors activate the building’s alarm notification appliances.

2. In occupancies not required to be equipped with a fire alarm system, actuation of a smoke detector shall activate a visible and an audible signal in an approved location. Smoke detector trouble conditions shall activate a visible or audible signal in an approved location and shall be identified as air duct detector trouble.

10.7.3.2 Special locking systems.
Where special locking systems are installed on means of escape doors in accordance with Clauses 11.10.1.9.6 or 11.10.1.9.7, an automatic detection system shall be installed as required by that clause.

10.7.3.3 Elevator emergency operation.
Automatic fire detectors installed for elevator emergency operation shall be installed in accordance with the provisions of ASME A17.1/CSA B44 and ISO 7240.

10.7.3.4 Wiring.
The wiring to the auxiliary devices and equipment used to accomplish the fire safety functions shall be monitored for integrity in accordance with ISO 7240.

10.7.4 Initiating devices.
Where manual or automatic alarm initiation is required as part of a fire alarm system, the initiating devices shall be installed in accordance with Clauses 10.7.4.1 through 10.7.4.3.1.

10.7.4.1 Protection of fire alarm control unit.
In areas that are not continuously occupied, a single smoke detector shall be provided at the location of each fire alarm control unit, notification appliance circuit power extenders, and supervising station transmitting equipment.

Exception: Where ambient conditions prohibit installation of a smoke detector, a heat detector shall be permitted.

10.7.4.2 Manual fire alarm boxes.
Where a manual fire alarm system is required by another clause of this Code, it shall be activated by fire alarm boxes installed in accordance with Clauses 10.7.4.2.1 through 10.7.4.2.6.

10.7.4.2.1 Location.
Manual fire alarm boxes shall be located not more than 1524 mm (5 feet) from the entrance to each exit. In buildings not protected by an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2, additional manual fire alarm boxes shall be located so that the distance of travel to the nearest box does not exceed 60 960 mm (200 feet).

10.7.4.2.2 Height.
The height of the manual fire alarm boxes shall be not less than 1067 mm (42 inches) and not more than 1372 mm (48 inches) measured vertically, from the floor level to the activating handle or lever of the box.

10.7.4.2.3 Color.
Manual fire alarm boxes shall be red in color.

10.7.4.2.4 Signs.
Where fire alarm systems are not monitored by a supervising station, an approved permanent sign shall be installed adjacent to each manual fire alarm box that reads: WHEN ALARM SOUNDS CALL FIRE DEPARTMENT.

Exception: Where the manufacturer has permanently provided this information on the manual fire alarm box.

10.7.4.2.5 Protective covers.
The fire Code official is authorized to require the installation of listed manual fire alarm box protective covers to prevent malicious false alarms or to provide the manual fire alarm box with protection from physical damage. The protective cover shall be transparent or red in color with a transparent face to permit visibility of the manual fire alarm box. Each cover shall include proper operating instructions. A protective cover that emits a local alarm signal shall not be installed unless approved. Protective covers shall not project more than that permitted by Clause 11.3.3.3.

10.7.4.2.6 Unobstructed and unobscured.
Manual fire alarm boxes shall be provided with ready access, unobstructed, unobscured and visible at all times.

10.7.4.3 Automatic smoke detection.
Where an automatic smoke detection system is required it shall utilize smoke detectors unless ambient conditions prohibit such an installation. In spaces where smoke detectors cannot be
utilized due to ambient conditions, approved automatic heat detectors shall be permitted.

10.7.4.3.1 Automatic sprinkler system.

For conditions other than specific fire safety functions noted in Clause 10.7.3, in areas where ambient conditions prohibit the installation of smoke detectors, an automatic sprinkler system installed in such areas in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 and that is connected to the fire alarm system shall be approved as automatic heat detection.

10.7.5 Occupant notification systems.

A fire alarm system shall annunciate at the fire alarm control unit and shall initiate occupant notification upon activation, in accordance with Clauses 10.7.5.1 through 10.7.5.2.3.3. Where a fire alarm system is required by another clause of this Code, it shall be activated by:

1. Automatic fire detectors.
2. Automatic sprinkler system workflow devices.
4. Automatic fire-extinguishing systems.

**Exception:** Where notification systems are allowed elsewhere in Clause 907 to annunciate at a constantly attended location

10.7.5.1 Presignal feature.

A presignal feature shall not be installed unless approved by the fire Code official. Where a presignal feature is provided, a signal shall be annunciated at a constantly attended location approved by the fire Code official so that occupant notification can be activated in the event of fire or other emergency.

10.7.5.2 Alarm notification appliances.

Alarm notification appliances shall be provided and shall be listed for their purpose.

10.7.5.2.1 Audible alarms.

Audible alarm notification appliances shall be provided and emit a distinctive sound that is not to be used for any purpose other than that of a fire alarm.

**Exceptions:**

1. Audible alarm notification appliances are not required in critical care areas of

Group I-2, Condition 2 occupancies that are in compliance with Clause 10.7.2.6, Exception 2.

2. A visible alarm notification appliance installed in a nurses’ control station or other continuously attended staff location in a Group I-2, Condition 2 suite shall be an acceptable alternative to the installation of audible alarm notification appliances throughout the suite in Group I-2, Condition 2 occupancies that are in compliance with Clause 10.7.2.6, Exception 2.

3. Where provided, audible notification appliances located in each enclosed occupant evacuation elevator lobby in accordance with Clause 31.8.9.1 shall be connected to a separate notification zone for manual paging only.

**10.7.5.2.1.1 Average sound pressure.**

The audible alarm notification appliances shall provide a sound pressure level of 15 decibels (dBA) above the average ambient sound level or 5 dBA above the maximum sound level having a duration of not less than 60 seconds, whichever is greater, in every occupiable space within the building.

**10.7.5.2.1.2 Maximum sound pressure.**

The maximum sound pressure level for audible alarm notification appliances shall be 110 dBA at the minimum hearing distance from the audible appliance. Where the average ambient noise is greater than 95 dBA, visible alarm notification appliances shall be provided in accordance with ISO 7240 and audible alarm notification appliances shall not be required.

**10.7.5.2.2 Emergency voice/alarm communication systems.**

Emergency voice/alarm communication systems required by this Code shall be designed and installed in accordance with ISO 7240. The operation of any automatic fire detector, sprinkler workflow device or manual fire alarm box shall automatically sound an alert tone followed by voice instructions giving approved information and directions for a general or staged evacuation in accordance with the building’s fire safety and evacuation plans required by Clause 404 of the Ghana Fire Code. In high-rise buildings, the system shall operate on at least the alarming floor, the floor above and the floor below. Speakers shall be provided throughout the building by paging
zones. At a minimum, paging zones shall be provided as follows:

1. Elevator groups.
2. Interior exit stairways.
3. Each floor.
4. Areas of refuge as defined in Part 2.

**Exception:** In Group I-1 and I-2 occupancies, the alarm shall sound in a constantly attended area and a general occupant notification shall be broadcast over the overhead page.

**10.7.5.2.2.1 Manual override.**
A manual override for emergency voice communication shall be provided on a selective and all-call basis for all paging zones.

**10.7.5.2.2.2 Live voice messages.**
The emergency voice/alarm communication system shall have the capability to broadcast live voice messages by paging zones on a selective and all-call basis.

**10.7.5.2.2.3 Alternative uses.**
The emergency voice/alarm communication system shall be allowed to be used for other announcements, provided that the manual fire alarm use takes precedence over any other use.

**10.7.5.2.2.4 Emergency voice/alarm communication captions.**
Where stadiums, arenas and grandstands have 15,000 fixed seats or more and provide audible public announcements, the emergency/voice alarm communication system shall provide pre-recorded or real-time captions. Prerecorded or live emergency captions shall be from an approved location constantly attended by personnel trained to respond to an emergency.

**10.7.5.2.2.5 Emergency power.**
Emergency voice/alarm communications systems shall be provided with emergency power in accordance with Clause 28.13. The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in ISO 7240.

**10.7.5.2.3 Visible alarms.**
Visible alarm notification appliances shall be provided in accordance with Clauses 10.7.5.2.3.1 through 10.7.5.2.3.3.

**Exceptions:**
1. Visible alarm notification appliances are not required in alterations, except where an existing fire alarm system is upgraded or replaced, or a new fire alarm system is installed.
2. Visible alarm notification appliances shall not be required in exits as defined in Part 2.
3. Visible alarm notification appliances shall not be required in elevator cars.
4. Visual alarm notification appliances are not required in critical care areas of Group I-2, Condition 2 occupancies that are in compliance with Clause 10.7.2.6, Exception 2.

**10.7.5.2.3.1 Public use areas and common use areas.**
Visible alarm notification appliances shall be provided in public use areas and common use areas.

**Exception:** Where employee work areas have audible alarm coverage, the notification appliance circuits serving the employee work areas shall be initially designed with not less than 20-percent spare capacity to account for the potential of adding visible notification appliances in the future to accommodate hearing-impaired employee(s).

**10.7.5.2.3.2 Groups I-1 and R-1.**
Habitable spaces in dwelling units and sleeping units in Group I-1 and R-1 occupancies in accordance with Table 10.7.5.2.3.2 shall be provided with visible alarm notification. Visible alarms shall be activated by the in-room smoke alarm and the building fire alarm system.

10.7.5.2.3.3 Group R-2.
In Group R-2 occupancies required by Clause 10.7 to have a fire alarm system, each storey that contains dwelling units and sleeping units shall be provided with the capability to support visible alarm notification appliances in accordance with Part 11 of ICC A117.1. Such capability shall accommodate wired or wireless equipment. The future capability shall include one of the following:

1. The interconnection of the building fire alarm system with the unit smoke alarms.

2. The replacement of audible appliances with combination audible/visible appliances.

3. The future extension of the existing wiring from the unit smoke alarm locations to required locations for visible appliances.

10.7.6 Installation and monitoring.
A fire alarm system shall be installed and monitored in accordance with Clauses 10.7.6.1 through 10.7.6.6.2 and ISO 7240.

10.7.6.1 Wiring.
Wiring shall comply with the requirements of Ghana Wiring Code and ISO 7240. Wireless protection systems utilizing radio-frequency transmitting devices shall comply with the special requirements for supervision of low-power wireless systems in ISO 7240.

10.7.6.2 Power supply.
The primary and secondary power supply for the fire alarm system shall be provided in accordance with ISO 7240.

Exception: Back-up power for single-station and multiple-station smoke alarms as required in Clause 10.7.2.10.6.

10.7.6.3 Initiating device identification.
The fire alarm system shall identify the specific initiating device address, location, device type, floor level where applicable and status including indication of normal, alarm, trouble and supervisory status, as appropriate.

Exceptions:

1. Fire alarm systems in single-storey buildings less than 2090 m$^2$ (22,500 square feet) in area.

2. Fire alarm systems that only include manual fire alarm boxes, waterflow initiating devices and not more than 10 additional alarm-initiating devices.

3. Special initiating devices that do not support individual device identification.

4. Fire alarm systems or devices that are replacing existing equipment.

10.7.6.3.1 Annunciation.
The initiating device status shall be annunciated at an approved on-site location.

10.7.6.4 Zones.
Each floor shall be zoned separately and a zone shall not exceed 2090 m$^2$ (22,500 square feet). The length of any zone shall not exceed 91 440 mm (300 feet) in any direction.

Exception: Automatic sprinkler system zones shall not exceed the area permitted by NFPA 13.

10.7.6.4.1 Zoning indicator panel.
A zoning indicator panel and the associated controls shall be provided in an approved location. The visual zone indication shall lock in until the system is reset and shall not be canceled by the operation of an audible-alarm silencing switch.

10.7.6.4.2 High-rise buildings.
In high-rise buildings, a separate zone by floor shall be provided for each of the following types of alarm-initiating devices where provided:

1. Smoke detectors.

2. Sprinkler waterflow devices.

4. Other approved types of automatic fire detection devices or suppression systems.
10.7.6.5 Access.
Access shall be provided to each fire alarm device and notification appliance for periodic inspection, maintenance and testing.

10.7.6.6 Monitoring.
Fire alarm systems required by this part or by the Ghana Fire Code shall be monitored by an approved supervising station in accordance with ISO 7240.

Exception: Monitoring by a supervising station is not required for:

1. Single- and multiple-station smoke alarms required by Clause 10.7.2.10.
2. Smoke detectors in Group I-3 occupancies.
3. Automatic sprinkler systems in one- and two-family dwellings.

10.7.6.6.1 Automatic telephone-dialing devices.
Automatic telephone-dialing devices used to transmit an emergency alarm shall not be connected to any fire department telephone number unless approved by the fire chief.

10.7.6.6.2 Termination of monitoring service.
Termination of fire alarm monitoring services shall be in accordance with Clause 10.1.9 of the Ghana Fire Code.

10.7.7 Acceptance tests and completion.
Upon completion of the installation, the fire alarm system and all fire alarm components shall be tested in accordance with ISO 7240.

10.7.7.1 Single- and multiple-station alarm devices.
When the installation of the alarm devices is complete, each device and interconnecting wiring for multiple-station alarm devices shall be tested in accordance with the smoke alarm provisions of ISO 7240.

10.7.7.2 Record of completion.
A record of completion in accordance with ISO 7240 verifying that the system has been installed and tested in accordance with the approved plans and specifications shall be provided.

10.7.7.3 Instructions.
Operating, testing and maintenance instructions and record drawings ("as-builds") and equipment specifications shall be provided at an approved location.

10.7.8 Inspection, testing and maintenance.
The maintenance and testing schedules and procedures for fire alarm and fire detection systems shall be in accordance with the Ghana Fire Code.

10.8 EMERGENCY ALARM SYSTEMS

10.8.1 Group H occupancies.
Emergency alarms for the detection and notification of an emergency condition in Group H occupancies shall be provided in accordance with Clause 4.15.5.

10.8.2 Group H-5 occupancy.
Emergency alarms for notification of an emergency condition in an HPM facility shall be provided as required in Clause 4.11.3.5.

10.9 SMOKE CONTROL SYSTEMS

10.9.1 Scope and purpose.
This clause applies to mechanical or passive smoke control systems where they are required by other provisions of this Code. The purpose of this clause is to establish minimum requirements for the design, installation and acceptance testing of smoke control systems that are intended to provide a tenable environment for the evacuation or relocation of occupants. These provisions are not intended for the preservation of contents, the timely restoration of operations or for assistance in fire suppression or overhaul activities. Smoke control systems regulated by this clause serve a different purpose than the smoke- and heat-removal provisions found in Clause 10.10. Mechanical smoke control systems shall not be considered exhaust systems under this Code.

10.9.2 General design requirements.
Buildings, structures or parts thereof required by this Code to have a smoke control system or systems shall have such systems designed in accordance with the applicable requirements of Clause 10.9 and the generally accepted and well-established principles of engineering relevant to the design. The construction documents shall include sufficient information
and detail to adequately describe the elements of the design necessary for the proper implementation of the smoke control systems. These documents shall be accompanied by sufficient information and analysis to demonstrate compliance with these provisions.

10.9.3 Special inspection and test requirements.

In addition to the ordinary inspection and test requirements that buildings, structures and parts thereof are required to undergo, smoke control systems subject to the provisions of Clause 10.9 shall undergo special inspections and tests sufficient to verify the proper commissioning of the smoke control design in its final installed condition. The design submission accompanying the construction documents shall clearly detail procedures and methods to be used and the items subject to such inspections and tests. Such commissioning shall be in accordance with generally accepted engineering practice and, where possible, based on published standards for the particular testing involved. The special inspections and tests required by this clause shall be conducted under the same terms in Clause 19.4

10.9.4 Analysis.

A rational analysis supporting the types of smoke control systems to be employed, their methods of operation, the systems supporting them and the methods of construction to be utilized shall accompany the submitted construction documents and shall include, but not be limited to, the items indicated in Clauses 10.9.4.1 through 10.9.4.7.

10.9.4.1 Stack effect.

The system shall be designed such that the maximum probable normal or reverse stack effect will not adversely interfere with the system's capabilities. In determining the maximum probable stack effect, altitude, elevation, weather storey and interior temperatures shall be used.

10.9.4.2 Temperature effect of fire.

Buoyancy and expansion caused by the design fire in accordance with Clause 10.9.9 shall be analyzed. The system shall be designed such that these effects do not adversely interfere with the system’s capabilities.

10.9.4.3 Wind effect.

The design shall consider the adverse effects of wind. Such consideration shall be consistent with the wind-loading provisions of Part 16.

10.9.4.4 HVAC systems.

The design shall consider the effects of the heating, ventilating and air-conditioning (HVAC) systems on both smoke and fire transport. The analysis shall include all permutations of systems status. The design shall consider the effects of the fire on the HVAC systems.

10.9.4.5 Climate.

The design shall consider the effects of low temperatures on systems, property and occupants. Air inlets and exhausts shall be located so as to prevent snow or ice blockage.

10.9.4.6 Duration of operation.

All portions of active or engineered smoke control systems shall be capable of continued operation after detection of the fire event for a period of not less than either 20 minutes or 1.5 times the calculated escape time, whichever is greater.

10.9.4.7 Smoke control system interaction.

The design shall consider the interaction effects of the operation of multiple smoke control systems for all design scenarios.

10.9.5 Smoke barrier construction.

Smoke barriers required for passive smoke control and a smoke control system using the pressurization method shall comply with Clause 8.9. The maximum allowable leakage area shall be the aggregate area calculated using the following leakage area ratios:

1. Walls: $A/A_w = 0.00100$
2. Interior exit stairways and ramps and exit passageways: $A/A_w = 0.00035$
3. Enclosed exit access stairways and ramps and all other shafts: $A/A_w = 0.00150$
4. Floors and roofs: $A/A_f = 0.00050$

where:

$A = \text{Total leakage area, } m^2$ (square feet).

$A_f = \text{Unit floor or roof area of barrier, } m^2$ (square feet).
A_w = \text{Unit wall area of barrier, m}^2 \text{ (square meter)}

The leakage area ratios shown do not include openings due to gaps around doors and operable windows. The total leakage area of the smoke barrier shall be determined in accordance with Clause 10.9.5.1 and tested in accordance with Clause 10.9.5.2.

10.9.5.1 Total leakage area.

Total leakage area of the barrier is the product of the smoke barrier gross area multiplied by the allowable leakage area ratio, plus the area of other openings such as gaps around doors and operable windows.

10.9.5.2 Testing of leakage area.

Compliance with the maximum total leakage area shall be determined by achieving the minimum air pressure difference across the barrier with the system in the smoke control mode for mechanical smoke control systems utilizing the pressurization method. Compliance with the maximum total leakage area of passive smoke control systems shall be verified through methods such as door fan testing or other methods, as approved by the fire Code official.

10.9.5.3 Opening protection.

Openings in smoke barriers shall be protected by automatic-closing devices actuated by the required controls for the mechanical smoke control system. Door openings shall be protected by fire door assemblies complying with Clause 8.16.

Exceptions:

1. Passive smoke control systems with automatic-closing devices actuated by spot-type smoke detectors listed for releasing service installed in accordance with Clause 10.7.3.

2. Fixed openings between smoke zones that are protected utilizing the airflow method.

3. In Group I-1, Condition 2; Group I-2; and ambulatory care facilities, where a pair of opposite-swinging doors is installed across a corridor in accordance with Clause 10.9.5.3.1, the doors shall not be required to be protected in accordance with Clause 8.16. The doors shall be close-fitting within operational tolerances and shall not have a center mullion or undercuts in excess of 19.1 mm (0.75 inch), louvers or grilles. The doors shall have fire and jamb stops and astragals or rabbets at meeting edges and, where permitted by the door manufacturer’s listing, positive-latching devices are not required.

4. In Group I-2 and ambulatory care facilities, where such doors are special-purpose horizontal sliding, accordion or folding door assemblies installed in accordance with Clause 11.10.1.4.3 and are automatic closing by smoke detection in accordance with Clause 8.16.2.6.5.

5. Group I-3.

6. Openings between smoke zones with clear ceiling heights of 14 feet (4267 mm) or greater and bank-down capacity of greater than 20 minutes as determined by the design fire size.

10.9.5.3.1 Group I-1, Condition 2; Group I-2; and ambulatory care facilities.

In Group I-1, Condition 2; Group I-2; and ambulatory care facilities, where doors are installed across a corridor, the doors shall be automatic closing by smoke detection in accordance with Clause 8.16.2.6.5 and shall have a vision panel with fire-protection-rated glazing materials in fire protection-rated frames, the area of which shall not exceed that tested.

10.9.5.3.2 Ducts and air transfer openings.

Ducts and air transfer openings are required to be protected with a minimum Class II, 121°C (250°F) smoke damper complying with Clause 8.17.

10.9.6 Pressurization method.

The primary mechanical means of controlling smoke shall be by pressure differences across smoke barriers. Maintenance of a tenable environment is not required in the smoke control zone of fire origin.

10.9.6.1 Minimum pressure difference.

The pressure difference across a smoke barrier used to separate smoke zones shall be not less than 0.05-inch water gage (0.0124 kPa) in fully sprinklered buildings.

In buildings permitted to be other than fully sprinklered, the smoke control system shall be designed to achieve pressure differences not less than two times the maximum calculated pressure difference produced by the design fire.
10.9.6.2 Maximum pressure difference.
The maximum air pressure difference across a smoke barrier shall be determined by required door-opening or closing forces. The actual force required to open exit doors when the system is in the smoke control mode shall be in accordance with Clause 10.10.1.3. Opening and closing forces for other doors shall be determined by standard engineering methods for the resolution of forces and reactions. The calculated force to set a side-hinged, swinging door in motion shall be determined by:

\[ F = F_{dc} + K(WA\Delta P)/(2(W-d)) \]

where:
- \( A \) = Door area, \( m^2 \) (square feet).
- \( D \) = Distance from door handle to latch edge of door, feet (m).
- \( F \) = Total door opening force, pounds (N).
- \( F_{dc} \) = Force required to overcome closing device, pounds (N).
- \( K \) = Coefficient 1.0 (5.2).
- \( W \) = Door width, m (feet).
- \( \Delta P \) = Design pressure difference, inches of water (Pa).

10.9.6.3 Pressurized stairways and elevator hoistways.
Where stairways or elevator hoistways are pressurized, such pressurization systems shall comply with Clause 10.9 as smoke control systems, in addition to the requirements of Clauses 10.9.20 of this Code and 10.9.21 of the Ghana Fire Code.

10.9.7 Airflow design method.
Where approved by the fire Code official, smoke migration through openings fixed in a permanently open position, which are located between smoke control zones by the use of the airflow method, shall be permitted. The design airflow shall be in accordance with this clause. Airflow shall be directed to limit smoke migration from the fire zone. The geometry of openings shall be considered to prevent flow reversal from turbulent effects. Smoke control systems using the airflow method shall be designed in accordance with the Ghana Fire Code.

10.9.7.1 Prohibited conditions.
This method shall not be employed where either the quantity of air or the velocity of the airflow will adversely affect other portions of the smoke control system, unduly intensify the fire, disrupt plume dynamics or interfere with exiting. Airflow toward the fire shall not exceed 200 feet per minute (1.02 m/s). Where the calculated airflow exceeds this limit, the airflow method shall not be used. (Equation 10-1)

10.9.8 Exhaust method.
Where approved by the fire Code official, mechanical smoke control for large enclosed volumes, such as in atriums or malls, shall be permitted to utilize the exhaust method. Smoke control systems using the exhaust method shall be designed in accordance with NFPA 92.

10.9.8.1 Smoke layer.
The height of the lowest horizontal surface of the smoke layer interface shall be maintained not less than 1829 mm (6 feet) above a walking surface that forms a portion of a required Escape system within the smoke zone.

10.9.9 Design fire.
The design fire shall be based on a rational analysis performed by the registered design professional and approved by the fire Code official. The design fire shall be based on the analysis in accordance with Clause 10.9.4 and this clause.

10.9.9.1 Factors considered.
The engineering analysis shall include the characteristics of the fuel, fuel load, effects included by the fire and whether the fire is likely to be steady or unsteady.

10.9.9.2 Design fire fuel.
Determination of the design fire shall include consideration of the type of fuel, fuel spacing and configuration.

10.9.9.3 Heat-release assumptions.
The analysis shall make use of best available data from approved sources and shall not be based on excessively stringent limitations of combustible material.

10.9.9.4 Sprinkler effectiveness assumptions.
A documented engineering analysis shall be provided for conditions that assume fire growth is halted at the time of sprinkler activation.
10.9.10 Equipment.
Equipment including, but not limited to, fans, ducts, automatic dampers and balance dampers, shall be suitable for its intended use, suitable for the probable exposure temperatures that the rational analysis indicates and as approved by the fire Code official.

10.9.10.1 Exhaust fans.
Components of exhaust fans shall be rated and certified by the manufacturer for the probable temperature rise to which the components will be exposed. This temperature rise shall be computed by:

\[ T_s = (Q_c / mc) + (T_a) \]  
(Equation 10-2)

where:
- \( c \) = Specific heat of smoke at smoke layer temperature, kJ/kg \cdot K (Btu/lb\(^\circ\)F).
- \( m \) = Exhaust rate, kg/s (pounds per second).
- \( Q_c \) = Convective heat output of fire, kW (Btu/s).
- \( T_a \) = Ambient temperature, K (\(^\circ\)F).
- \( T_s \) = Smoke temperature, K (\(^\circ\)F).

Exception: Reduced \( T_s \) as calculated based on the assurance of adequate dilution air.

10.9.10.2 Ducts.
Duct materials and joints shall be capable of withstanding the probable temperatures and pressures to which they are exposed as determined in accordance with Clause 10.9.10.1. Ducts shall be constructed and supported in accordance with the International Mechanical Code. Ducts shall be leak tested to 1.5 times the maximum design pressure in accordance with nationally accepted practices. Measured leakage shall not exceed 5 percent of design flow. Results of such testing shall be part of the documentation procedure. Ducts shall be supported directly from fire-resistance-rated structural elements of the building by substantial, noncombustible supports.

Exception: Flexible connections, for the purpose of vibration isolation, complying with this Code and that are constructed of approved fire-resistance-rated materials.

10.9.10.3 Equipment, inlets and outlets.
Equipment shall be located so as to not expose uninvolved portions of the building to an additional fire hazard. Outside air inlets shall be located so as to minimize the potential for introducing smoke or flame into the building. Exhaust outlets shall be so located as to minimize reintroduction of smoke into the building and to limit exposure of the building or adjacent buildings to an additional fire hazard.

10.9.10.4 Automatic dampers.
Automatic dampers, regardless of the purpose for which they are installed within the smoke control system, shall be listed and conform to the requirements of approved, recognized standards.

10.9.10.5 Fans.
In addition to other requirements, belt-driven fans shall have 1.5 times the number of belts required for the design duty, with the minimum number of belts being two. Fans shall be selected for stable performance based on normal temperature and, where applicable, elevated temperature. Calculations and manufacturer’s fan curves shall be part of the documentation procedures. Fans shall be supported and restrained by noncombustible devices in accordance with the requirements of this Code.

Motors driving fans shall not be operated beyond their nameplate horsepower (kilowatts), as determined from measurement of actual current draw, and shall have a minimum service factor of 1.15.

10.9.11 Standby power.
Smoke control systems shall be provided with standby power in accordance with Clause 28.13.

10.9.11.1 Equipment room.
The standby power source and its transfer switches shall be in a room separate from the normal power transformers and switch gears and ventilated directly to and from the exterior. The room shall be enclosed with not less than 1-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

10.9.11.2 Power sources and power surges.
Elements of the smoke control system relying on volatile memories or the like shall be
supplied with uninterruptable power sources of sufficient duration to span 15-minute primary power interruption. Elements of the smoke control system susceptible to power surges shall be suitably protected by conditioners, suppressors or other approved means.

10.9.12 Detection and control systems. Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Clause 10.7. Such systems shall be equipped with a control unit complying with this Code and listed as smoke control equipment.

10.9.12.1 Verification.
Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override and the presence of power downstream of all disconnects. A preprogrammed weekly test sequence shall report abnormal conditions audibly, visually and by printed report. The preprogrammed weekly test shall operate all devices, equipment and components used for smoke control.

Exception: Where verification of individual components tested through the preprogrammed weekly testing sequence will interfere with, and produce unwanted effects to, normal building operation, such individual components are permitted to be bypassed from the preprogrammed weekly testing, where approved by the building official and in accordance with both of the following:

1. Where the operation of components is bypassed from the preprogrammed weekly test, presence of power downstream of all disconnects shall be verified weekly by a listed control unit.

2. Testing of all components bypassed from the preprogrammed weekly test shall be in accordance with Clause 10.9.20.6 of the Ghana Fire Code.

10.9.12.2 Wiring.
In addition to meeting requirements of Ghana Wiring Code, all wiring, regardless of voltage, shall be fully enclosed within continuous raceways.

10.9.12.3 Activation.
Smoke control systems shall be activated in accordance with this clause.

10.9.12.3.1 Pressurization, airflow or exhaust method.
Mechanical smoke control systems using the pressurization, airflow or exhaust method shall have completely automatic control.

10.9.12.3.2 Passive method.
Passive smoke control systems actuated by approved spot-type detectors listed for releasing service shall be permitted.

10.9.12.4 Automatic control.
Where completely automatic control is required or used, the automatic-control sequences shall be initiated from an appropriately zoned automatic sprinkler system complying with Clause 10.3.3.1.1, manual controls provided with ready access for the fire department and any smoke detectors required by engineering analysis.

10.9.13 Control air tubing.
Control air tubing shall be of sufficient size to meet the required response times. Tubing shall be flushed clean and dry prior to final connections and shall be adequately supported and protected from damage. Tubing passing through concrete or masonry shall be sleeved and protected from abrasion and electrolytic action.

Control-air tubing shall be hard-drawn copper, Type L, ACR in accordance with ASTM B42, ASTM B43, ASTM B68, ASTM B88, ASTM B251 and ASTM B280. Fittings shall be wrought copper or brass, solder type in accordance with ASME B16.18 or ASME B16.2. Changes in direction shall be made with appropriate tool bends. Brass compression-type fittings shall be used at final connection to devices; other joints shall be brazed using a BCuP-5 brazing alloy with solidus above 1, 593°C (100°F) and liquids below 816°C (1,500°F). Brazing flux shall be used on copper-to-brass joints only.

Exception: Nonmetallic tubing used within control panels and at the final connection to devices provided that all of the following conditions are met:

1. Tubing shall comply with the requirements of this Code.
2. Tubing and connected devices shall be completely enclosed within a galvanized or paint-grade steel enclosure having a minimum thickness of 0.7534 mm (0.0296 inch) (No. 22 gauge). Entry to the enclosure shall be by copper tubing with a protective grommet of neoprene or Teflon or by suitable brass compression to male barbed adapter.

3. Tubing shall be identified by appropriately documented coding.

4. Tubing shall be neatly tied and supported within the enclosure. Tubing bridging cabinets and doors or moveable devices shall be of sufficient length to avoid tension and excessive stress. Tubing shall be protected against abrasion. Tubing connected to devices on doors shall be fastened along hinges.

10.9.13.2 Isolation from other functions. Control tubing serving other than smoke control functions shall be isolated by automatic isolation valves or shall be an independent system.

10.9.13.3 Testing. Control air tubing shall be tested at three times the operating pressure for not less than 30 minutes without any noticeable loss in gauge pressure prior to final connection to devices.

10.9.14 Marking and identification. The detection and control systems shall be clearly marked at all junctions, accesses and terminations.

10.9.15 Control diagrams. Identical control diagrams showing all devices in the system and identifying their location and function shall be maintained current and kept on file with the fire Code official, the fire department and in the fire command center in a format and manner approved by the fire official.

10.9.16 Fire fighter’s smoke control panel. A fire fighter’s smoke control panel for fire department emergency response purposes only shall be provided and shall include manual control or override of automatic control for mechanical smoke control systems. The panel shall be located in a fire command center complying with Clause 10.11 in high-rise buildings or buildings with smoke-protected assembly seating. In all other buildings, the fire fighter’s smoke control panel shall be installed in an approved location adjacent to the fire alarm control panel. The fire fighter’s smoke control panel shall comply with Clauses 10.9.16.1 through 10.9.16.3.

10.9.16.1 Smoke control systems. Fans within the building shall be shown on the fire fighter’s control panel. A clear indication of the direction of airflow and the relationship of components shall be displayed. Status indicators shall be provided for all smoke control equipment, annunciated by fan and zone, and by piplot-lamp-type indicators as follows:

1. Fans, dampers and other operating equipment in their normal status—WHITE.
2. Fans, dampers and other operating equipment in their off or closed status—RED.
3. Fans, dampers and other operating equipment in their on or open status—GREEN.
4. Fans, dampers and other operating equipment in a fault status—YELLOW/AMBER.

10.9.16.2 Smoke control panel. The fire fighter’s control panel shall provide control capability over the complete smoke control system equipment within the building as follows:

1. ON-AUTO-OFF control over each individual piece of operating smoke control equipment that can be controlled from other sources within the building. This includes stairway pressurization fans; smoke exhaust fans; supply, return and exhaust fans; elevator shaft fans and other operating equipment used or intended for smoke control purposes.
2. OPEN-AUTO-CLOSE control over individual dampers relating to smoke control and that are controlled from other sources within the building.
3. ON-OFF or OPEN-CLOSE control over smoke control and other critical equipment associated with a fire or smoke emergency and that can only be controlled from the fire fighter’s control panel.

Exceptions:

1. Complex systems, where approved, where the controls and indicators are combined to control and indicate all elements of a single smoke zone as a unit.

2. Complex systems, where approved, where the control is accomplished by computer interface using approved, plain English commands.

10.9.16.3 Control action and priorities.
The fire-fighter’s control panel actions shall be as follows:

1. ON-OFF and OPEN-CLOSE control actions shall have the highest priority of any control point within the building. Once issued from the fire fighter’s control panel, automatic or manual control from any other control point within the building shall not contradict the control action. Where automatic means are provided to interrupt normal, nonemergency equipment operation or produce a specific result to safeguard the building or equipment including, but not limited to, duct freezestats, duct smoke detectors, high-temperature cutouts, temperature-actuated linkage and similar devices, such means shall be capable of being overridden by the fire fighter’s control panel. The last control action as indicated by each fire fighter’s control panel switch position shall prevail. Control actions shall not require the smoke control system to assume more than one configuration at any one time.

   Exception: Power disconnects required by Ghana Wiring Code.

2. Only the AUTO position of each three-position fire-fighter’s control panel switch shall allow automatic or manual control action from other control points within the building. The AUTO position shall be the NORMAL, nonemergency, building control position. Where a fire fighter’s control panel is in the AUTO position, the actual status of the device (on, off, open, closed) shall continue to be indicated by the status indicator described in Clause 10.9.16.1. Where directed by an automatic signal to assume an emergency condition, the NORMAL position shall become the emergency condition for that device or group of devices within the zone. Control actions shall not require the smoke control system to assume more than one configuration at any one time.

10.9.17 System response time.
Smoke-control system activation shall be initiated immediately after receipt of an appropriate automatic or manual activation command. Smoke control systems shall activate individual components (such as dampers and fans) in the sequence necessary to prevent physical damage to the fans, dampers, ducts and other equipment. For purposes of smoke control, the fire fighter’s control panel response time shall be the same for automatic or manual smoke control action initiated from any other building control point. The total response time, including that necessary for detection, shutdown of operating equipment and smoke control system startup, shall allow for full operational mode to be achieved before the conditions in the space exceed the design smoke condition. The system response time for each component and their sequential relationships shall be detailed in the required rational analysis and verification of their installed condition reported in the required final report.

10.9.18 Acceptance testing.
Devices, equipment, components and sequences shall be individually tested. These tests, in addition to those required by other provisions of this Code, shall consist of determination of function, sequence and, where applicable, capacity of their installed condition.
10.9.18.1 Detection devices.
Smoke or fire detectors that are a part of a smoke control system shall be tested in accordance with Part 9 in their installed condition. Where applicable, this testing shall include verification of airflow in both minimum and maximum conditions.

10.9.18.2 Ducts.
Ducts that are a part of a smoke control system shall be traversed using generally accepted practices to determine actual air quantities.

10.9.18.3 Dampers.
Dampers shall be tested for function in their installed condition.

10.9.18.4 Inlets and outlets.
Inlets and outlets shall be read using generally accepted practices to determine air quantities.

10.9.18.5 Fans.
Fans shall be examined for correct rotation. Measurements of voltage, amperage, revolutions per minute (rpm) and belt tension shall be made.

10.9.18.6 Smoke barriers.
Measurements using inclined manometers or other approved calibrated measuring devices shall be made of the pressure differences across smoke barriers. Such measurements shall be conducted for each possible smoke control condition.

10.9.18.7 Controls.
Each smoke zone equipped with an automatic-initiation device shall be put into operation by the actuation of one such device. Each additional device within the zone shall be verified to cause the same sequence without requiring the operation of fan motors in order to prevent damage. Control sequences shall be verified throughout the system, including verification of override from the fire fighter’s control panel and simulation of standby power conditions.

10.9.18.8 Testing for smoke control.
Smoke control systems shall be tested by a special inspector in accordance with Clause 19.5.16.

10.9.18.8.1 Scope of testing.
Testing shall be conducted in accordance with the following:

- During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.
- Prior to occupancy and after sufficient completion for the purposes of pressure-difference testing, flow measurements, and detection and control verification.

10.9.18.8.2 Qualifications.
Approved agencies for smoke control testing shall have expertise in fire protection engineering, mechanical engineering and certification as air balancers.

10.9.18.8.3 Reports.
A complete report of testing shall be prepared by the approved agency. The report shall include identification of all devices by manufacturer, nameplate data, design values, measured values and identification tag or mark. The report shall be reviewed by the responsible registered design professional and, when satisfied that the design intent has been achieved, the responsible registered design professional shall sign, seal and date the report.

10.9.18.8.3.1 Report filing.
A copy of the final report shall be filed with the fire Code official and an identical copy shall be maintained in an approved location at the building.

10.9.19 System acceptance.
Buildings, or portions thereof, required by this Code to comply with this clause shall not be issued a certificate of occupancy until such time that the fire Code official determines that the
provisions of this clause have been fully complied with and that the fire department has received satisfactory instruction on the operation, both automatic and manual, of the system and a written maintenance program complying with the requirements of Clause 10.9.20.1 of the Ghana Fire Code has been submitted and approved by the fire Code official.

Exception: In buildings of phased construction, a temporary certificate of occupancy, as approved by the fire Code official, shall be allowed provided that those portions of the building to be occupied meet the requirements of this clause and that the remainder does not pose a significant hazard to the safety of the proposed occupants or adjacent buildings.

10.9.20 Smoke proof enclosures.

Where required by Clause 11.23.11, a smokeproof enclosure shall be constructed in accordance with this clause. A smokeproof enclosure shall consist of an interior exit stairway or ramp that is enclosed in accordance with the applicable provisions of Clause 11.23 and an open exterior balcony or ventilated vestibule meeting the requirements of this clause. Where access to the roof is required by the Ghana Fire Code, such access shall be from the smokeproof enclosure where a smokeproof enclosure is required.

10.9.20.1 Access.

Access to the stairway or ramp shall be by way of a vestibule or an open exterior balcony. The minimum dimension of the vestibule shall be not less than the required width of the corridor leading to the vestibule but shall not have a width of less than 1118 mm (44 inches) and shall not have a length of less than 1829 mm (72 inches) in the direction of Escape travel.

10.9.20.2 Construction.

The smokeproof enclosure shall be separated from the remainder of the building by not less than 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. The open exterior balcony shall be constructed in accordance with the fire-resistance rating requirements for floor assemblies.

10.9.20.2.1 Door closers.

Doors in a smokeproof enclosure shall be self- or automatic closing by actuation of a smoke detector in accordance with Clause 8.16.2.6.6 and shall be installed at the floor-side entrance to the smokeproof enclosure. The actuation of the smoke detector on any door shall activate the closing devices on all doors in the smokeproof enclosure at all levels. Smoke detectors shall be installed in accordance with Clause 10.7.3.

10.9.20.3 Natural ventilation alternative.

The provisions of Clauses 10.9.20.3.1 through 10.9.20.3.3 shall apply to ventilation of smokeproof enclosures by natural means.

10.9.20.3.1 Balcony doors.

Where access to the stairway or ramp is by way of an open exterior balcony, the door assembly into the enclosure shall be a fire door assembly in accordance with Clause 8.16.

10.9.20.3.2 Vestibule doors.

Where access to the stairway or ramp is by way of a vestibule, the door assembly into the vestibule shall be a fire door assembly complying with Clause 8.16. The door assembly from the vestibule to the stairway shall have not less than a 20-minute fire protection rating complying with Clause 8.16.

10.9.20.3.3 Vestibule ventilation.

Each vestibule shall have a minimum net area of 16 square feet (1.5 m²) of opening in a wall facing an outer court, yard or public way that is not less than 20 feet (6096 mm) in width.

10.9.20.4 Mechanical ventilation alternative.

The provisions of Clauses 10.9.20.4.1 through 10.9.20.4.4 shall apply to ventilation of smokeproof enclosures by mechanical means.

10.9.20.4.1 Vestibule doors.

The door assembly from the building into the vestibule shall be a fire door assembly complying with Clause 8.16.2.2.1. The door assembly from the vestibule to the stairway or ramp shall not have less than a 20-minute fire protection rating and shall meet the requirements for a smoke door assembly in
accordance with Clause 8.16.2.2.1. The door shall be installed in accordance with the Ghana Fire Code.

10.9.20.4.2 Vestibule ventilation.
The vestibule shall be supplied with not less than one air change per minute and the exhaust shall be not less than 150 percent of supply. Supply air shall enter and exhaust air shall discharge from the vestibule through separate, tightly constructed ducts used only for that purpose. Supply air shall enter the vestibule within 152 mm (6 inches) of the floor level. The top of the exhaust register shall be located at the top of the smoke trap but not more than 152 mm (6 inches) down from the top of the trap, and shall be entirely within the smoke trap area. Doors in the open position shall not obstruct duct openings. Duct openings with controlling dampers are permitted where necessary to meet the design requirements, but dampers are not otherwise required.

10.9.20.4.2.1 Engineered ventilation system.
Where a specially engineered system is used, the system shall exhaust a quantity of air equal to not less than 90 air changes per hour from any vestibule in the emergency operation mode and shall be sized to handle three vestibules simultaneously. Smoke detectors shall be located at the floor-side entrance to each vestibule and shall activate the system for the affected vestibule. Smoke detectors shall be installed in accordance with Clause 10.7.3.

10.9.20.4.3 Smoke trap.
The vestibule ceiling shall be not less than 20 inches (508 mm) higher than the door opening into the vestibule to serve as a smoke and heat trap and to provide an upward-moving air column. The height shall not be decreased unless approved and justified by design and test.

10.9.20.4.4 Stairway or ramp shaft air movement system.
The stairway or ramp shaft shall be provided with a dampered relief opening and supplied with sufficient air to maintain a minimum positive pressure of 25 Pa (0.10 inch of water) in the shaft relative to the vestibule with all doors closed.

10.9.20.5 Stairway and ramp pressurization alternative.
Where the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, the vestibule is not required, provided that each interior exit stairway or ramp is pressurized to not less than 25 Pa (0.10 inch of water) and not more than 87 Pa (0.35 inches of water) in the shaft relative to the building measured with all interior exit stairway and ramp doors closed under maximum anticipated conditions of stack effect and wind effect.

10.9.20.6 Ventilating equipment.
The activation of ventilating equipment required by the alternatives in Clauses 10.9.20.4 and 10.9.20.5 shall be by smoke detectors installed at each floor level at an approved location at the entrance to the smokeproof enclosure. When the closing device for the stairway and ramp shaft and vestibule doors is activated by smoke detection or power failure, the mechanical equipment shall activate and operate at the required performance levels. Smoke detectors shall be installed in accordance with Clause 10.7.3.

10.9.20.6.1 Ventilation systems.
Smokeproof enclosure ventilation systems shall be independent of other building ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or connected to the smokeproof enclosure by ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

2. Equipment, control wiring, power wiring and ductwork shall be located within the smokeproof enclosure with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with
Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

3. Equipment, control wiring, power wiring and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

Exceptions:

1. Control wiring and power wiring located outside of a 2-hour fire barrier construction shall be protected using any one of the following methods:

   1.1. Cables used for survivability of required critical circuits shall be listed in accordance with this Code and shall have a fire-resistance rating of not less than 2 hours.

   1.2. Where encased with not less than 51 mm (2 inches) of concrete.

   1.3. Electrical circuit protective systems shall have a fire-resistance rating of not less than 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

10.9.20.6.2 Standby power.
Mechanical vestibule and stairway and ramp shaft ventilation systems and automatic fire detection systems shall be provided with standby power in accordance with Clause 28.13.

10.9.20.6.3 Acceptance and testing.
Before the mechanical equipment is approved, the system shall be tested in the presence of the building official to confirm that the system is operating in compliance with these requirements.

10.9.21 Elevator hoistway pressurization alternative.
Where elevator hoistway pressurization is provided in lieu of required enclosed elevator lobbies, the pressurization system shall comply with Clauses 10.9.21.1 through 10.9.21.11.

10.9.21.1 Pressurization requirements.
Elevator hoistways shall be pressurized to maintain a minimum positive pressure of 25 Pa (0.10 inch of water) and a maximum positive pressure of 67 Pa (0.25 inch of water) with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all elevator cars at the floor of recall and all hoistway doors on the floor of recall open and all other hoistway doors closed. The pressure differentials shall be measured between the hoistway and the adjacent elevator landing. The opening and closing of hoistway doors at each level must be demonstrated during this test. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 6096 mm (20 feet) from any air exhaust system or outlet.

Exceptions:

1. On floors containing only Group R occupancies, the pressure differential is permitted to be measured between the hoistway and a dwelling unit or sleeping unit.

2. Where an elevator opens into a lobby enclosed in accordance with this Code, the pressure differential is permitted to be measured between the hoistway and the space immediately outside the door(s) from the floor to the enclosed lobby.

3. The pressure differential is permitted to be measured relative to the outdoor atmosphere on floors other than the following:
3.1. The fire floor.

3.2. The two floors immediately below the fire floor.

3.3. The floor immediately above the fire floor.

4. The minimum positive pressure of 25 Pa (0.10 inch of water) and a maximum positive pressure of 67 Pa (0.25 inch of water) with respect to occupied floors are not required at the floor of recall with the doors open.

10.9.21.1 Use of ventilation systems.
Ventilation systems, other than hoistway supply air systems, are permitted to be used to exhaust air from adjacent spaces on the fire floor, two floors immediately below and one floor immediately above the fire floor to the building’s exterior where necessary to maintain positive pressure relationships as required in Clause 10.9.21.1 during operation of the elevator shaft pressurization system.

10.9.21.2 Rational analysis.
A rational analysis complying with Clause 10.9.4 shall be submitted with the construction documents.

10.9.21.3 Ducts for system.
Any duct system that is part of the pressurization system shall be protected with the same fire-resistance rating as required for the elevator shaft enclosure.

909.21.4 Fan system.
The fan system provided for the pressurization system shall be as required by Clauses 10.9.21.4.1 through 10.9.21.4.4.

10.9.21.4.1 Fire resistance.
Where located within the building, the fan system that provides the pressurization shall be protected with the same fire-resistance rating required for the elevator shaft enclosure.

10.9.21.4.2 Smoke detection.
The fan system shall be equipped with a smoke detector that will automatically shut down the fan system when smoke is detected within the system.

10.9.21.4.3 Separate systems.
A separate fan system shall be used for each elevator hoistway.

10.9.21.4.4 Fan capacity.
The supply fan shall be either adjustable with a capacity of not less than 0.4719 m$^3$/s (1,000 cfm) per door, or that specified by a registered design professional to meet the requirements of a designed pressurization system.

10.9.21.5 Standby power.
The pressurization system shall be provided with standby power in accordance with Clause 28.13.

10.9.21.6 Activation of pressurization system.
The elevator pressurization system shall be activated upon activation of either the building fire alarm system or the elevator lobby smoke detectors. Where both a building fire alarm system and elevator lobby smoke detectors are present, each shall be independently capable of activating the pressurization system.

10.9.21.7 Testing.
Testing for performance shall be required in accordance with Clause 10.9.18.8. System acceptance shall be in accordance with Clause 10.9.19.

10.9.21.8 Marking and identification.
Detection and control systems shall be marked in accordance with Clause 10.9.14.

10.9.21.9 Control diagrams.
Control diagrams shall be provided in accordance with Clause 10.9.15.

10.9.21.10 Control panel.
A control panel complying with Clause 10.9.16 shall be provided.

10.9.21.11 System response time.
Hoistway pressurization systems shall comply with the requirements for smoke control system response time in Clause 10.9.17.

10.10 SMOKE AND HEAT REMOVAL

10.10.1 General.
Where required by this Code, smoke and heat vents or mechanical smoke removal systems shall conform to the requirements of this clause.

10.10.2 Where required.
Smoke and heat vents or a mechanical smoke
removal system shall be installed as required by Clauses 10.10.2.1 and 10.10.2.2.

Exceptions:

1. Frozen food warehouses used solely for storage of Class I and II commodities where protected by an approved automatic sprinkler system.
2. Smoke and heat removal shall not be required in areas of buildings equipped with early suppression fast-response (ESFR) sprinklers.
3. Smoke and heat removal shall not be required in areas of buildings equipped with control mode special application sprinklers with a response time index of $50 \ (m \cdot s)^{1/2}$ or less that are listed to control a fire in stored commodities with 12 or fewer sprinklers.

10.10.2.1 Group F-1 or S-1.
Smoke and heat vents installed in accordance with Clause 10.10.3 or a mechanical smoke removal system installed in accordance with Clause 10.10.4 shall be installed in buildings and portions thereof used as a Group F-1 or S-1 occupancy having more than $4645 \ m^2$ (50,000 square feet) of undivided area. In occupied portions of a building equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 where the upper surface of the storey is not a roof assembly, a mechanical smoke removal system in accordance with Clause 10.10.4 shall be installed.

Exception: Group S-1 aircraft repair hangars.

10.10.2.2 High-piled combustible storage.
Smoke and heat removal required by the Ghana Fire Code for buildings and portions thereof containing high-piled combustible storage shall be installed in accordance with Clause 10.10.3 in unsprinklered buildings. In buildings and portions thereof containing high-piled combustible storage equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, a smoke and heat removal system shall be installed in accordance with Clause 10.10.3 or 10.10.4. In occupied portions of a building equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, where the upper surface of the storey is not a roof assembly, a mechanical smoke removal system in accordance with Clause 10.10.4 shall be installed.

10.10.3 Smoke and heat vents.
The design and installation of smoke and heat vents shall be in accordance with Clauses 10.10.3.1 through 10.10.3.3.

10.10.3.1 Listing and labeling.
Smoke and heat vents shall be listed and labeled to indicate compliance with this Code.

10.10.3.2 Smoke and heat vent locations.
Smoke and heat vents shall be located 6096 mm (20 feet) or more from adjacent plot lines and fire walls and 3048 mm (10 feet) or more from fire barriers. Vents shall be uniformly located within the roof in the areas of the building where the vents are required to be installed by Clause 10.10.2 with consideration given to roof pitch, sprinkler location and structural members.

10.10.3.3 Smoke and heat vents area.
The required aggregate area of smoke and heat vents shall be calculated as follows:

For buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1:

$$A_{VR} = \frac{V}{9000} \ (Equation \ 10-3)$$

where:

$$A_{VR} = \text{The required aggregate vent area} \ (ft^2).$$

$$V = \text{Volume} \ (ft^3) \ of \ the \ area \ that \ requires \ smoke \ removal.$$ 

For unsprinklered buildings:

$$A_{VR} = \frac{A_{FA}}{50} \ (Equation \ 10-4)$$

where:

$$A_{VR} = \text{The required aggregate vent area} \ (ft^2).$$

$$A_{FA} = \text{The area of the floor in the area that requires smoke removal}.$$ 

10.10.4 Mechanical smoke removal systems.
Mechanical smoke removal systems shall be
designed and installed in accordance with Clauses 10.10.4.1 through 10.10.4.7.

10.10.4.1 Automatic sprinklers required. The building shall be equipped throughout with an approved automatic sprinkler system in accordance with Clause 10.3.3.1.1.

10.10.4.2 Exhaust fan construction. Exhaust fans that are part of a mechanical smoke removal system shall be rated for operation at 105°C (221°F). Exhaust fan motors shall be located outside of the exhaust fan air stream.

10.10.4.3 System design criteria. The mechanical smoke removal system shall be sized to exhaust the building at a minimum rate of two air changes per hour based on the volume of the building or portion thereof without contents. The capacity of each exhaust fan shall not exceed 14.2 m³/s (30,000 cubic feet per minute).

10.10.4.3.1 Makeup air. Makeup air openings shall be provided within 1829 mm (6 feet) of the floor level. Operation of makeup air openings shall be manual or automatic. The minimum gross area of makeup air inlets shall be 0.74 m² per 0.4719 m³/s (8 square feet per 1,000 cubic feet per minute) of smoke exhaust.

10.10.4.4 Activation. The mechanical smoke removal system shall be activated by manual controls only.

10.10.4.5 Manual control location. Manual controls shall be located where they are able to be accessed by the fire service from an exterior door of the building and separated from the remainder of the building by not less than a 1-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

10.10.4.6 Control wiring. Wiring for operation and control of mechanical smoke removal systems shall be connected ahead of the main disconnect in accordance with the Ghana Wiring Code and be protected against interior fire exposure to temperatures in excess of 1,000°F (538°C) for a period of not less than 15 minutes.

10.10.4.7 Controls. Where building air-handling and mechanical smoke removal systems are combined or where independent building air-handling systems are provided, fans shall automatically shut down in accordance with this Code. The manual controls provided for the smoke removal system shall have the capability to override the automatic shutdown of fans that are part of the smoke removal system.

10.10.5 Maintenance. Smoke and heat vents and mechanical smoke removal systems shall be maintained in accordance with the Ghana Fire Code.

10.11 FIRE COMMAND CENTER

10.11.1 General. Where required by other clauses of this Code and in buildings classified as high-rise buildings by this Code, a fire command center for fire department operations shall be provided and shall comply with Clauses 10.11.1.1 through 10.11.1.6.

10.11.1.1 Location and access. The location and accessibility of the fire command center shall be approved by the fire Code official.

10.11.1.2 Separation. The fire command center shall be separated from the remainder of the building by not less than the 1-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assembly constructed in accordance with Clause 8.11, or both.

10.11.1.3 Size. The room shall be not less than 19 m² (200 square feet) with a minimum dimension of 3048 mm (10 feet).

10.11.1.4 Layout approval. A layout of the fire command center and all features required by this clause to be contained therein shall be submitted for approval prior to installation.

10.11.1.5 Storage. Storage unrelated to operation of the fire command center shall be prohibited.

10.11.1.6 Required features. The fire command center shall comply with ISO 7240 and shall contain all of the following features:

1. The emergency voice/alarm communication system control unit.
2. The fire department communications system.

3. Fire detection and alarm system annunciator.

4. Annunciator unit visually indicating the location of the elevators and whether they are operational.

5. Status indicators and controls for air distribution systems.

6. The fire fighter’s control panel required by Clause 10.9.16 for smoke control systems installed in the building.

7. Controls for unlocking interior exit stairway doors simultaneously.

8. Sprinkler valve and waterflow detector display panels.

9. Emergency and standby power status indicators.

10. A telephone for fire department use with controlled access to the public telephone system.

11. Fire pump status indicators.

12. Schematic building plans indicating the typical floor plan and detailing the building core, means of Escape, fire protection systems, fire fighter air replenishment system, fire-fighting equipment and fire department access and the location of fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions.

13. An approved Building Information Card that contains, but is not limited to, the following information:
   13.1. General building information that includes: property name, address, the number of floors in the building above and below grade, use and occupancy classification (for mixed uses, identify the different types of occupancies on each floor), and the estimated building population during the day, night and weekend.
   13.2. Building emergency contact information that includes: a list of the building’s emergency contacts including but not limited to building manager and building engineer and their respective work phone number, cell phone number, e-mail address.
   13.3. Building construction information that includes: the type of building construction including but not limited to floors, walls, columns, and roof assembly.
   13.4. Exit access and exit stairway information that includes: number of exit access and exit stairways in the building, each exit access and exit stairway designation and floors served, location where each exit access and exit stairway discharges, interior exit stairways that are pressurized, exit stairways provided with emergency lighting, each exit stairway that allows reentry, exit stairways providing roof access; elevator information that includes: number of elevator banks, elevator bank designation, elevator car numbers and respective floors that they serve; location of elevator machine rooms, control rooms and control spaces; location of sky lobby, location of freight elevator banks.

13.5. Building services and system information that includes: location of mechanical rooms, location of building management system, location and capacity of all fuel oil tanks, location
of emergency generator, location of natural gas service.

13.6. Fire protection system information that includes: location of standpipes, location of fire pump room, location of fire department connections, floors protected by automatic sprinklers, location of different types of automatic sprinkler systems installed including, but not limited to, dry, wet and pre-action.

13.7 Hazardous material information that includes: location of hazardous material, quantity of hazardous material.

15. Generator supervision devices, manual start and transfer features.

16. Public address system, where specifically required by other clauses of this Code.

17. Elevator fire recall switch in accordance with ASME A17.1/BSA 44.

18. Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.

### 10.12 Fire Department Connections

**10.12.1 Installation.**

Fire department connections shall be installed in accordance with the Ghana Fire Code applicable to the system design and shall comply with Clauses 10.12.2 through 10.12.6.

**10.12.2 Location.**

With respect to hydrants, driveways, buildings and landscaping, fire department connections shall be so located that fire apparatus and hose connected to supply the system will not obstruct access to the buildings for other fire apparatus. The location of fire department connections shall be approved by the fire Code official.

**10.12.2.1 Visible location.**

Fire department connections shall be located on the street side of buildings or facing approved fire apparatus access roads, fully visible and recognizable from the street, fire apparatus access road or nearest point of fire department vehicle access or as otherwise approved by the fire Code official.

**10.12.2.2 Existing buildings.**

On existing buildings, wherever the fire department connection is not visible to approaching fire apparatus, the fire department connection shall be indicated by an approved sign mounted on the street front or on the side of the building. Such sign shall have the letters “FDC” not less than 6 inches (152 mm) high and words in letters not less than 2 inches (51 mm) high or an arrow to indicate the location. Such signs shall be subject to the approval of the fire Code official.

**10.12.3 Fire hose threads.**

Fire hose threads used in connection with Fire hydrant systems shall be approved and shall be compatible with fire department hose threads.

**10.12.4 Access.**

Immediate access to fire department connections shall be maintained at all times and without obstruction by fences, bushes, trees, walls or any other fixed or moveable object. Access to fire department connections shall be approved by the fire Code official.

**Exception:** Fences, where provided with an access gate equipped with a sign complying with the legend requirements of this clause and a means of emergency operation. The gate and the means of emergency operation shall be approved by the fire Code official and maintained operational at all times.

**10.12.4.1 Locking fire department connection caps.**

The fire Code official is authorized to require locking caps on fire department connections for water-based fire protection systems where the responding fire department carries appropriate key wrenches for removal.

**10.2.4.2 Clear space around connections.**

A working space of not less than 762 mm (36 inches) in width, 914 mm (36 inches) in depth
and 1981 mm (78 inches) in height shall be provided and maintained in front of and to the sides of wall-mounted fire department connections and around the circumference of free-standing fire department connections, except as otherwise required or approved by the fire Code official.

10.12.4.3 Physical protection.
Where fire department connections are subject to impact by a motor vehicle, vehicle impact protection shall be provided in accordance with the Ghana Fire Code.

10.12.5 Signs.
A metal sign with raised letters not less than 25 mm (1 inch) in size shall be mounted on all fire department connections serving automatic sprinklers, standpipes or fire pump connections. Such signs shall read: AUTOMATIC SPRINKLERS or STANDPIPES or TEST CONNECTION or a combination thereof as applicable. Where the fire department connection does not serve the entire building, a sign shall be provided indicating the portions of the building served.

10.12.6 Backflow protection.
The potable water supply to automatic sprinkler and Fire hydrant systems shall be protected against backflow as required by this Code.

10.13 FIRE PUMPS

10.13.1 General.
Where provided, fire pumps shall be installed in accordance with this clause.

10.13.2 Protection against interruption of service.
The fire pump, driver and controller shall be protected in accordance with the Ghana Fire Code against possible interruption of service through damage caused by explosion, fire, flood, earthquake, rodents, insects, windstorm, freezing, vandalism and other adverse conditions.

10.13.2.1 Protection of fire pump rooms.
Fire pumps shall be located in rooms that are separated from all other areas of the building by 2-hour fire barriers constructed in accordance with Clause 8.7 or 2-hour horizontal assemblies constructed in accordance with Clause 8.11, or both.

Exceptions:

1. In other than high-rise buildings, separation by 1-hour fire barriers constructed in accordance with Clause 8.7 or 1-hour horizontal assemblies constructed in accordance with Clause 8.11, or both, shall be permitted in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

2. Separation is not required for fire pumps physically separated in accordance with the Ghana Fire Code.

10.13.2.2 Circuits supplying fire pumps.
Cables used for survivability of circuits supplying fire pumps shall be protected using one of the following methods:

1. Cables used for survivability of required critical circuits shall be listed in accordance with this Code and shall have a fire-resistance rating of not less than 1 hour.

2. Electrical circuit protective systems shall have a fire-resistance rating of not less than 1 hour. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

3. Construction having a fire-resistance rating of not less than 1 hour.

10.13.3 Temperature of pump room.
Suitable means shall be provided for maintaining the temperature of a pump room or pump house, where required, above 5°C (40°F).

10.13.3.1 Engine manufacturer’s recommendation.
Temperature of the pump room, pump house or area where engines are installed shall never be less than the minimum recommended by the engine manufacturer. The engine manufacturer’s recommendations for oil heaters shall be followed.

10.13.4 Valve supervision.
Where provided, the fire pump suction, discharge and bypass valves, and isolation valves on the backflow prevention device or assembly shall be supervised open by one of the following methods:
1. Central-station, proprietary or remote-station signaling service.

2. Local signaling service that will cause the sounding of an audible signal at a constantly attended location.

3. Locking valves open.

4. Sealing of valves and approved weekly recorded inspection where valves are located within fenced enclosures under the control of the owner.

10.13.4.1 Test outlet valve supervision. Fire pump test outlet valves shall be supervised in the closed position.

10.13.5 Acceptance test. Acceptance testing shall be done in accordance with the requirements of the Ghana Fire Code.

10.14 EMERGENCY RESPONDER SAFETY FEATURES

10.14.1.1 Exterior access to shaftways. Outside openings accessible to the fire department and that open directly on a hoistway or shaftway communicating between two or more floors in a building shall be plainly marked with the word “SHAFTWAY” in red letters not less than 152 mm (6 inches) high on a white background. Such warning signs shall be placed so as to be readily discernible from the outside of the building.

10.14.1.2 Interior access to shaftways. Door or window openings to a hoistway or shaftway from the interior of the building shall be plainly marked with the word “SHAFTWAY” in red letters not less than 6 inches (152 mm) high on a white background. Such warning signs shall be placed so as to be readily discernible.

Exception: Markings shall not be required on shaftway openings that are readily discernible as openings onto a shaftway by the construction or arrangement.

10.14.2 Equipment room identification. Fire protection equipment shall be identified in an approved manner. Rooms containing controls for air-conditioning systems, sprinkler risers and valves or other fire detection, suppression or control elements shall be identified for the use of the fire department. Approved signs required to identify fire protection equipment and equipment location shall be constructed of durable materials, permanently installed and readily visible.

10.15 CARBON MONOXIDE DETECTION

10.15.1 General. Carbon monoxide detection shall be installed in new buildings in accordance with Clauses 915.1.1 through 915.6. Carbon monoxide detection shall be installed in existing buildings in accordance with Part 11 of the Ghana Fire Code.

10.15.1.1 Where required. Carbon monoxide detection shall be provided in Group I-1, I-2, I-4 and R occupancies and in classrooms in Group E occupancies in the locations specified in Clause 10.15.2 where any of the conditions in Clauses 10.15.1.2 through 10.15.1.6 exist.

10.15.1.2 Fuel-burning appliances and fuel-burning fireplaces. Carbon monoxide detection shall be provided in dwelling units, sleeping units and classrooms that contain a fuel-burning appliance or a fuel-burning fireplace.

10.15.1.3 Fuel burning, forced-air furnaces. Carbon monoxide detection shall be provided in dwelling units, sleeping units and classrooms served by a fuel-burning, forced-air furnace.

Exception: Carbon monoxide detection shall not be required in dwelling units, sleeping units and classrooms if a carbon monoxide detector is provided in the first room or area served by each main duct leaving the furnace, and the carbon monoxide alarm signals are automatically transmitted to an approved location.

10.15.1.4 Fuel-burning appliances outside of dwelling units, sleeping units and
classrooms. Carbon monoxide detection shall be provided in dwelling units, sleeping units and classrooms located in buildings that contain fuel-burning appliances or fuel-burning fireplaces.

Exceptions:

1. Carbon monoxide detection shall not be required in dwelling units, sleeping units and classrooms without communicating openings between the fuel-burning appliance or fuel-burning fireplace and the dwelling unit, sleeping unit or classroom.

2. Carbon monoxide detection shall not be required in dwelling units, sleeping units and classrooms where a carbon monoxide detector is provided in one of the following locations:

   2.1. In an approved location between the fuel-burning appliance or fuel-burning fireplace and the dwelling unit, sleeping unit or classroom.

   2.2. On the ceiling of the room containing the fuel-burning appliance or fuel-burning fireplace.

10.15.1.5 Private garages. Carbon monoxide detection shall be provided in dwelling units, sleeping units and classrooms in buildings with attached private garages.

Exceptions:

1. Carbon monoxide detection shall not be required in dwelling units, sleeping units and classrooms without communicating openings between the private garage and the dwelling unit, sleeping unit or classroom.

2. Carbon monoxide detection shall not be required in dwelling units, sleeping units and classrooms located more than one story above or below a private garage.

3. Carbon monoxide detection shall not be required where the private garage connects to the building through an open-ended corridor.

4. Where a carbon monoxide detector is provided in an approved location between openings to a private garage and dwelling units, sleeping units or classrooms.

10.15.1.6 Exempt garages. For determining compliance with Clause 10.15.1.5, an open parking garage complying with Clause 4.6.5 or an enclosed parking garage complying with Clause 4.6.6 shall not be considered a private garage.

10.15.2 Locations. Where required by Clause 10.15.1.1, carbon monoxide detection shall be installed in the locations specified in Clauses 10.15.2.1 through 10.15.2.3.

10.15.2.1 Dwelling units. Carbon monoxide detection shall be installed in dwelling units outside of each separate sleeping area in the immediate vicinity of the bedrooms. Where a fuel-burning appliance is located within a bedroom or its attached bathroom, carbon monoxide detection shall be installed within the bedroom.

10.15.2.2 Sleeping units. Carbon monoxide detection shall be installed in sleeping units.

Exception: Carbon monoxide detection shall be allowed to be installed outside of each separate sleeping area in the immediate vicinity of the sleeping unit where the sleeping unit or its attached bathroom does not contain a fuel-burning appliance and is not served by a forced air furnace.

10.15.2.3 Group E occupancies. Carbon monoxide detectors shall be installed in classrooms in Group E occupancies. Carbon monoxide alarm signals shall be automatically transmitted to an on-site location that is staffed by school personnel.

Exception: Carbon monoxide alarm signals shall not be required to be automatically transmitted to an on-site location that is staffed by school personnel in Group E occupancies with an occupant load of 30 or less.
10.15.3 Carbon monoxide detection.
Carbon monoxide detection required by Clauses 10.15.1 through 10.15.2.3 shall be provided by carbon monoxide alarms complying with Clause 10.15.4 or carbon monoxide detection systems complying with Clause 10.15.5.

10.15.4 Carbon monoxide alarms.
Carbon monoxide alarms shall comply with Clauses 10.15.4.1 through 10.15.4.4.

10.15.4.1 Power source.
Carbon monoxide alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than that required for overcurrent protection.

Exception: Where installed in buildings without commercial power, battery-powered carbon monoxide alarms shall be an acceptable alternative.

10.15.4.2 Listings.
Carbon monoxide alarms shall be listed in accordance with this Code.

10.15.4.3 Locations.
Carbon monoxide alarms shall only be installed in dwelling units and in sleeping units. They shall not be installed in locations where the Code requires carbon monoxide detectors to be used.

10.15.4.4 Combination alarms.
Combination carbon monoxide/smoke alarms shall be an acceptable alternative to carbon monoxide alarms. Combination carbon monoxide/smoke alarms shall be listed in accordance with this Code.

10.15.5 Carbon monoxide detection systems.
Carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide alarms and shall comply with Clauses 10.15.5.1 through 10.15.5.3.

10.15.5.1 General.
Carbon monoxide detection systems shall comply with ISO 72400. Carbon monoxide detectors shall be listed in accordance with this Code.

10.15.5.2 Locations.
Carbon monoxide detectors shall be installed in the locations specified in Clause 10.15.2.

These locations supersede the locations specified in ISO 72400.

10.15.5.3 Combination detectors.
Combination carbon monoxide/smoke detectors installed in carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide detectors, provided that they are listed in accordance with this Code.

10.15.6 Maintenance.
Carbon monoxide alarms and carbon monoxide detection systems shall be maintained in accordance with the Ghana Fire Code.

10.16 GAS DETECTION SYSTEMS

10.16.1 Gas detection systems.
Gas detection systems required by this Code shall comply with Clauses 10.16.2 through 916.11.

10.16.2 Permits.
Permits shall be required as set forth in the Ghana Fire Code.

10.16.2.1 Construction documents.
Documentation of the gas detection system design and equipment to be used that demonstrates compliance with the requirements of this Code shall be provided with the application for permit.

10.16.3 Equipment.
Gas detection system equipment shall be designed for use with the gases being detected and shall be installed in accordance with manufacturer’s instructions.

10.16.4 Power connections.
Gas detection systems shall be permanently connected to the building electrical power supply or shall be permitted to be cord connected to an unswitched receptacle using an approved restraining means that secures the plug to the receptacle.

10.16.5 Emergency and standby power.
Standby or emergency power shall be provided or the gas detection system shall initiate a trouble signal at an approved location if the power supply is interrupted.

10.16.6 Sensor locations.
Sensors shall be installed in approved locations where leaking gases are expected to accumulate.
10.16.7 Gas sampling.
Gas sampling shall be performed continuously. Sample analysis shall be processed immediately after sampling, except as follows:

1. For HPM gases, sample analysis shall be performed at intervals not exceeding 30 minutes.
2. For toxic gases, sample analysis shall be performed at intervals not exceeding 5 minutes in accordance with the Ghana Fire Code.
3. Where a less frequent or delayed sampling interval is approved.

10.16.8 System activation.
A gas detection alarm shall be initiated where any sensor detects a concentration of gas exceeding the following thresholds:

1. For flammable gases, a gas concentration exceeding 25 percent of the lower flammability limit (LFL).
2. For nonflammable gases, a gas concentration exceeding one-half of the IDLH, unless a different threshold is specified by the clause of this Code requiring a gas detection system.

Upon activation of a gas detection alarm, alarm signals or other required responses shall be as specified by the clause of this Code requiring a gas detection system. Audible and visible alarm signals associated with a gas detection alarm shall be distinct from fire alarm and carbon monoxide alarm signals.

10.16.9 Signage.
Signs shall be provided adjacent to gas detection system alarm signaling devices that advise occupants of the nature of the signals and actions to take in response to the signal.

10.16.10 Fire alarm system connections.
Gas sensors and gas detection systems shall not be connected to fire alarm systems unless approved and connected in accordance with the fire alarm equipment manufacturer’s instructions.

10.16.11 Inspection, testing and sensor calibration.
Gas detection systems and sensors shall be inspected, tested and calibrated in accordance with the Ghana Fire Code.

10.17 MASS NOTIFICATION SYSTEMS

10.17.1 College and university campuses.
Prior to construction of a new building requiring a fire alarm system on a multiple-building college or university campus having a cumulative building occupant load of 1,000 or more, a mass notification risk analysis shall be conducted in accordance with ISO 7240. Where the risk analysis determines a need for mass notification, an approved mass notification system shall be provided in accordance with the findings of the risk analysis.

10.18 EMERGENCY RESPONDER RADIO COVERAGE

10.18.1 General.
Emergency responder radio coverage shall be provided in all new buildings in accordance with the Ghana Fire Code.
PART 11: MEANS OF ESCAPE

User notes:

About this part: Part 11 provides the general criteria for designing the means of escape established as the primary method for protection of people in buildings by allowing timely relocation or evacuation of building occupants. Both prescriptive and performance language is utilized in this part to provide for a basic approach in the determination of a safe exiting system for all occupancies. It addresses all portions of the escape system (exit access, exits and exit discharge) and includes design requirements as well as provisions regulating individual components. The requirements detail the size, arrangement, number and protection of means of escape components. Functional and operational characteristics that will permit the safe use of components without special knowledge or effort are specified.

The means of escape protection requirements work in coordination with other Clauses of the Code, such as protection of vertical openings (see Part 8), interior finish (see Part 9), fire suppression and detection systems (see Part 10) and numerous others, all having an impact on life safety. Part 11 is subdivided into four main Clauses: general (Clauses 11.3–11.15), exit access (Clauses 11.16–11.21), exit (Clauses 11.22–11.27) and exit discharge (Clause 11.28). Special allowances for the unique requirements for assembly spaces (Clause 11.29) and emergency escape and rescue openings (Clause 11.30) complete the part. Part 11 of this Code is duplicated in Part 10 of the Ghana Fire Code®; however, the Ghana Fire Code contains one additional Clause on maintenance of the means of Escape system in existing buildings.

11.1 ADMINISTRATION

11.1.1 General.

Buildings or portions thereof shall be provided with a means of escape system as required by this part. The provisions of this part shall control the design, construction and arrangement of means of escape components required to provide an approved means of escape from structures and portions thereof.

11.1.2 Minimum requirements.

It shall be unlawful to alter a building or structure in a manner that will reduce the number of exits or the minimum width or required capacity of the means of escape to less than required by this Code.

11.2 MAINTENANCE AND PLANS

11.2.1 Maintenance.

Means of escape shall be maintained in accordance with the Ghana Fire Code.

11.2.2 Fire safety and evacuation plans.

Fire safety and evacuation plans shall be provided for all occupancies and buildings where required by the Ghana Fire Code. Such fire safety and evacuation plans shall comply with the applicable provisions of the Ghana Fire Code.

11.3 GENERAL MEANS OF ESCAPE

11.3.1 Applicability.

The general requirements specified in Clauses 11.3 through 11.15 shall apply to all three elements of the means of escape system, in addition to those specific requirements for the exit access, the exit and the exit discharge detailed elsewhere in this part.

11.3.2 Ceiling height.

The means of escape shall have a ceiling height of not less than 2286 mm (7 feet 6 inches) above the finished floor.

Exceptions:

1. Sloped ceilings in accordance with this Code.
2. Ceilings of dwelling units and sleeping units within residential occupancies in accordance with this Code.
3. Allowable projections in accordance with Clause 11.3.3.
4. Stair headroom in accordance with Clause 11.11.3.
5. Door height in accordance with Clause 11.10.1.1.
6. Ramp headroom in accordance with Clause 11.12.5.2.
7. The clear height of floor levels in vehicular and pedestrian traffic areas of public and private parking garages in accordance with Clause 4.6.2.2.
8. Areas above and below mezzanine floors in accordance with Clause 6.8.2.
11.3.3 Protruding objects.

Protruding objects on circulation paths shall comply with the requirements of Clauses 11.3.3.1 through 11.3.3.4.

11.3.3.1 Headroom.

Protruding objects are permitted to extend below the minimum ceiling height required by Clause 11.3.2 where a minimum headroom of 2032 mm (80 inches) is provided over any circulation paths, including walks, corridors, aisles and passageways. Not more than 50 percent of the ceiling area of a means of escape shall be reduced in height by protruding objects.

Exception: Door closers and stops shall not reduce headroom to less than 1981 mm (78 inches).

A barrier shall be provided where the vertical clearance above a circulation path is less than 2032 mm (80 inches) high above the finished floor. The leading edge of such a barrier shall be located 686 mm (27 inches) maximum above the finished floor.

11.3.3.2 Post-mounted objects.

A free-standing object mounted on a post or pylon shall not overhang that post or pylon more than 102 mm (4 inches) where the lowest point of the leading edge is more than 686 mm (27 inches) and less than 2032 mm (80 inches) above the finished floor. Where a sign or other obstruction is mounted between posts or pylons and the clear distance between the posts or pylons is greater than 305 mm (12 inches), the lowest edge of such sign or obstruction shall be 686 mm (27 inches) maximum or 2032 mm (80 inches) minimum above the finished floor or ground.

Exception: These requirements shall not apply to sloping portions of handrails between the top and bottom riser of stairs and above the ramp run.

11.3.3.3 Horizontal projections.

Objects with leading edges more than 685 mm (27 inches) and not more than 2030 mm (80 inches) above the finished floor shall not project horizontally more than 102 mm (4 inches) into the circulation path.

Exception: Handrails are permitted to protrude 114 mm (41/2 inches) from the wall or guard.

11.3.3.4 Clear width.

Protruding objects shall not reduce the minimum clear width of accessible routes.

11.3.4 Slip-resistant surface.

Circulation paths of the means of escape shall have a slip-resistant surface and be securely attached.

11.3.5 Elevation change.

Where changes in elevation of less than 305 mm (12 inches) exist in the means of escape, sloped surfaces shall be used. Where the slope is greater than one unit vertical in 20 units horizontal (5-percent slope), ramps complying with Clause 11.12 shall be used. Where the difference in elevation is 152 mm (6 inches) or less, the ramp shall be equipped with either handrails or floor finish materials that contrast with adjacent floor finish materials.

Exceptions:

1. A single step with a maximum riser height of 178 mm (7 inches) is permitted for buildings with occupancies in Groups F, H, R-2, R-3, S and U at exterior doors not required to be accessible by Part 11.

2. A stair with a single riser or with two risers and a tread is permitted at locations not required to be accessible by Part 11 where the risers and treads comply with Clause 11.11.5, the minimum depth of the tread is 330 mm (13 inches) and not less than one handrail complying with Clause 11.14 is provided within 762 mm (30 inches) of the centreline of the normal path of escape travel on the stair.

3. A step is permitted in aisles serving seating that has a difference in elevation less than 305 mm (12 inches) at locations not required to be accessible by Part 12, provided that the risers and treads comply with Clause 11.29.14 and the aisle is provided with a handrail complying with Clause 11.29.16.

Throughout a storey in a Group I-2 occupancy, any change in elevation in portions of the means of Escape that serve nonambulatory persons shall be by means of a ramp or sloped walkway.
11.3.6 Means of Escape continuity.
The path of escape travel along a means of escape shall not be interrupted by a building element other than a means of escape component as specified in this part. Obstructions shall not be placed in the minimum width or required capacity of a means of escape component except projections permitted by this part. The minimum width or required capacity of a means of escape system shall not be diminished along the path of escape travel.

11.3.7 Elevators, escalators and moving walks.
Elevators, escalators and moving walks shall not be used as a component of a required means of escape from any other part of the building.

Exception: Elevators used as an accessible means of escape in accordance with Clause 11.9.4.

11.4 OCCUPANT LOAD
11.4.1 Design occupant load.
In determining means of escape requirements, the number of occupants for whom means of escape facilities are provided shall be determined in accordance with this Clause.

11.4.1.1 Methods of Measurement
The following methods of measurement apply specifically to B1. Other methods of measurement applicable more widely throughout this Document are given in the definitions in Appendix D, and illustrated in Appendix C.

(a) Occupant capacity of a:

(i) room or storey - is the maximum number of persons it is designed to hold (where this is known) or the number calculated (using the occupancy load factors given in Table 1.1) from - area of room or storey (m²) occupancy load factor

Note: ‘area’ excludes stairway enclosures, lifts and sanitary accommodation.

(ii) building or part of a building - is the sum of the number of occupants of the storeys in the building or part.

(b) Travel distance - is by way of the shortest route, which if:

(i) there is fixed seating or other fixed obstructions, is along the centre line of the seatways and gangways;

(ii) it includes a stairway, is along the pitch line on the centre line of travel.

(c) Width - The width of:

(i) a doorway is the clear width when the door or doors are open. Door hardware which does not intrude more than 100 mm into this width may be ignored. (see Figure 1);

Note: It is assumed that the door or doors are free to open to an angle of at least 90°.

(ii) an escape route is the width at 1500 mm above floor level when defined by walls (handrails fixed to walls which do not intrude more than 100 mm into this width may be ignored) or elsewhere the minimum width of passage available between any fixed obstructions; and

(iii) a stairway is the clear width between the walls or balustrades, (strings and handrails intruding not more than 30 mm and 100 mm respectively may be ignored).

11.4.2 Cumulative occupant loads.
Where the path of escape travel includes intervening rooms, areas or spaces, cumulative occupant loads shall be determined in accordance with this Clause.

11.4.2.1 Intervening spaces or accessory areas.
Where occupants escape from one or more rooms, areas or spaces through others, the design occupant load shall be the combined occupant load of interconnected accessory or intervening spaces. Design of escape path capacity shall be based on the cumulative portion of occupant loads of all rooms, areas or spaces to that point along the path of escape travel.

11.4.2.2 Adjacent levels for mezzanines.
That portion of the occupant load of a mezzanine with required escape through a room, area or space on an adjacent level shall
be added to the occupant load of that room, area or space.

11.4.2.3 Adjacent stories.

Other than for the escape components designed for convergence in accordance with Clause 11.5.6, the occupant load from separate stories shall not be added.

11.4.3 Multiple function occupant load.

Where an area under consideration contains multiple functions having different occupant load factors, the design occupant load for such area shall be based on the floor area of each function calculated independently.

11.4.4 Multiple occupancies.

Where a building contains two or more occupancies, the means of escape requirements shall apply to each portion of the building based on the occupancy of that space. Where two or more occupancies utilize portions of the same means of escape system, those escape components shall meet the more stringent requirements of all occupancies that are served.

11.4.5 Areas without fixed seating.

The number of occupants shall be computed at the rate of one occupant per unit of area as prescribed in Table 11.4.5. For areas without fixed seating, the occupant load shall be not less than that number determined by dividing the floor area under consideration by the occupant load factor assigned to the function of the space as set forth in Table 11.4.5. Where an intended function is not listed in Table 11.4.5, the building official shall establish a function based on a listed function that most nearly resembles the intended function.

Exception: Where approved by the building official, the actual number of occupants for whom each occupied space, floor or building is designed, although less than those determined by calculation, shall be permitted to be used in the determination of the design occupant load.

</tbody>
</table>

Note: For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

a. Floor area in square feet per occupant.

11.4.5.1 Increased occupant load.

The occupant load permitted in any building, or portion thereof, is permitted to be increased from that number established for the
occupancies in Table 11.4.5, provided that all other requirements of the Code are met based on such modified number and the occupant load does not exceed one occupant per 0.65 m² (7 square feet) of occupiable floor space. Where required by the building official, an approved aisle, seating or fixed equipment diagram substantiating any increase in occupant load shall be submitted. Where required by the building official, such diagram shall be posted.

11.4.6 Fixed seating.

For areas having fixed seats and aisles, the occupant load shall be determined by the number of fixed seats installed therein. The occupant load for areas in which fixed seating is not installed, such as waiting spaces, shall be determined in accordance with Clause 11.4.5 and added to the number of fixed seats.

The occupant load of wheelchair spaces and the associated companion seat shall be based on one occupant for each wheelchair space and one occupant for the associated companion seat provided in accordance with this Code.

For areas having fixed seating without dividing arms, the occupant load shall be not less than the number of seats based on one person for each 457 mm (18 inches) of seating length.

The occupant load of seating booths shall be based on one person for each 610 mm (24 inches) of booth seat length measured at the backrest of the seating booth.

11.4.7 Outdoor areas.

Yards, patios, occupied roofs, courts and similar outdoor areas accessible to and usable by the building occupants shall be provided with means of escape as required by this part. The occupant load of such outdoor areas shall be assigned by the building official in accordance with the anticipated use. Where outdoor areas are to be used by persons in addition to the occupants of the building, and the path of escape travel from the outdoor areas passes through the building, means of escape requirements for the building shall be based on the sum of the occupant loads of the building plus the outdoor areas.

Exceptions:

11.4.8 Concentrated business use areas.

The occupant load factor for concentrated business use shall be applied to telephone call centres, trading floors, electronic data processing centres and similar business use areas with a higher density of occupants than would normally be expected in a typical business occupancy environment. Where approved by the building official, the occupant load for concentrated business use areas shall be the actual occupant load, but not less than one occupant per 4.65 m² (50 square feet) of gross occupiable floor space.

11.4.9 Posting of occupant load.

Every room or space that is an assembly occupancy shall have the occupant load of the room or space posted in a conspicuous place, near the main exit or exit access doorway from the room or space, for the intended configurations. Posted signs shall be of an approved legible permanent design and shall be maintained by the owner or the owner's authorized agent.

11.5 MEANS OF ESCAPE SIZING

11.5.1 General.

All portions of the means of escape system shall be sized in accordance with this Clause.

Exception: Aisles and aisle access ways in rooms or spaces used for assembly purposes complying with Clause 11.29.

11.5.2 Minimum width based on component.

The minimum width, in mm (inches), of any means of escape components shall be not less than that specified for such component, elsewhere in this Code.
11.5.3 Required capacity based on occupant load.

The required capacity, in mm (inches), of the means of escape for any room, area, space or storey shall be not less than that determined in accordance with Clauses 11.5.3.1 and 11.5.3.2:

11.5.3.1 Stairways.

The capacity, in inches, of means of escape stairways shall be calculated by multiplying the occupant load served by such stairways by a means of escape capacity factor of 7.6 mm (0.3 inch) per occupant. Where stairways serve more than one storey, only the occupant load of each storey considered individually shall be used in calculating the required capacity of the stairways serving that storey.

Exceptions:

1. For other than Group H and I-2 occupancies, the capacity, in inches, of means of escape stairways shall be calculated by multiplying the occupant load served by such stairways by a means of escape capacity factor of 5.1 mm (0.2 inch) per occupant in buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 and an emergency voice/alarm communication system in accordance with Clause 10.7.5.2.2.

2. Facilities with smoke-protected assembly seating shall be permitted to use the capacity factors in Table 11.29.6.2 indicated for level or ramped aisles for means of escape components other than stairways where the entire path for means of escape from the seating to the exit discharge is provided with a smoke control system complying with Clause 10.9.

3. Facilities with open-air assembly seating shall be permitted to the capacity factors in Clause 11.29.6.3 indicated for stepped aisles for exit access or exit stairways where the entire path for means of escape from the seating to the exit discharge is open to the outdoors.

11.5.3.2 Other Escape components.

The capacity, in inches, of means of escape components other than stairways shall be calculated by multiplying the occupant load served by such component by a means of escape capacity factor of 5.1 mm (0.2 inch) per occupant.

Exceptions:

1. For other than Group H and I-2 occupancies, the capacity, in inches, of means of escape components other than stairways shall be calculated by multiplying the occupant load served by such component by a means of escape capacity factor of 3.8 mm (0.15 inch) per occupant in buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 and an emergency voice/alarm communication system in accordance with Clause 10.7.5.2.2.

2. Facilities with smoke-protected assembly seating shall be permitted to use the capacity factors in Table 11.29.6.2 indicated for level or ramped aisles for means of escape components other than stairways where the entire path for means of escape from the seating to the exit discharge is provided with a smoke control system complying with Clause 10.9.

3. Facilities with open-air assembly seating shall be permitted to the capacity factors in Clause 11.29.6.3 indicated for level or ramped aisles for means of escape components other than stairways where the entire path for means of escape from the seating to the exit discharge is open to the outdoors.

11.5.4 Continuity.

The minimum width or required capacity of the means of escape required from any storey of a building shall not be reduced along the path of escape travel until arrival at the public way.
11.5.5 Distribution of minimum width and required capacity.

Where more than one exit, or access to more than one exit, is required, the means of escape shall be configured such that the loss of any one exit, or access to one exit, shall not reduce the available capacity or width to less than 50 percent of the required capacity or width.

11.5.6 Escape convergence.

Where the means of escape from stories above and below converge at an intermediate level, the capacity of the means of escape from the point of convergence shall be not less than the largest minimum width or the sum of the required capacities for the stairways or ramps serving the two adjacent stories, whichever is larger.

11.5.7 Encroachment.

Encroachments into the required means of escape width shall be in accordance with the provisions of this Clause.

11.5.7.1 Doors.

Doors, when fully opened, shall not reduce the required width by more than 178 mm (7 inches). Doors in any position shall not reduce the required width by more than one-half.

Exceptions:

1. Surface-mounted latch release hardware shall be exempt from inclusion in the 178 mm (7-inch maximum) encroachment where both of the following conditions exist:
   1.1. The hardware is mounted to the side of the door facing away from the adjacent wall where the door is in the open position.
   1.2. The hardware is mounted not less than 865 mm (34 inches) nor more than 1219 mm (48 inches) above the finished floor.

2. The restrictions on door swing shall not apply to doors within individual dwelling units and sleeping units of Group R-2 occupancies and dwelling units of Group R-3 occupancies.

11.5.7.2 Other projections.

Handrail projections shall be in accordance with the provisions of Clause 11.14.8. Other nonstructural projections such as trim and similar decorative features shall be permitted to project into the required width not more than 38 mm (11/2 inches) on each side.

Exception: Projections are permitted in corridors within Group I-2 Condition 1 in accordance with Clause 4.7.4.3.

11.5.7.3 Protruding objects.

Protruding objects shall comply with the applicable requirements of Clause 11.3.3.

11.6 NUMBER OF EXITS AND EXIT ACCESS DOORWAYS

11.6.1 General.

The number of exits or exit access doorways required within the means of escape system shall comply with the provisions of Clause 11.6.2 for spaces, including mezzanines, and Clause 11.6.3 for stories or occupied roofs.

11.6.2 Escape from spaces.

Rooms, areas or spaces, including mezzanines, within a storey or basement shall be provided with the number of exits or access to exits in accordance with this Clause.

11.6.2.1 Escape based on occupant load and common path of Escape travel distance.

Two exits or exit access doorways from any space shall be provided where the design occupant load or the common path of Escape travel distance exceeds the values listed in Table 11.6.2.1. The cumulative occupant load from adjacent rooms, areas or spaces shall be determined in accordance with Clause 11.4.2.

1. The number of exits from foyers, lobbies, vestibules or similar spaces need not be based on cumulative occupant loads for areas discharging through such spaces, but the capacity of the exits from such spaces shall be based on applicable cumulative occupant loads.
2. Care suites in Group I-2 occupancies complying with Clause 4.7.4.

NP = Not Permitted.

- a. Buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2. See Clause 10.3 for occupancies where automatic sprinkler systems are permitted in accordance with Clause 10.3.3.1.2.
- b. Group H occupancies equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.2.5. For the travel distance limitations in Group I-2, see Clause 4.7.4.
- c. For a room or space used for assembly purposes having fixed seating, see Clause 11.29.8.
- d. For the travel distance limitations in Group R-3 and R-4 equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.3, see Clause 11.6.2.2.6.
- e. The common path of Escape travel distance shall only apply in a Group R-3 occupancy located in a mixed occupancy building.
- f. The length of common path of Escape travel distance in a Group S-2 open parking garage shall be not more than 100 feet.
- g. For the travel distance limitations in Groups R-3 and R-4 equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.3, see Clause 11.6.2.2.6.

#### 11.6.2.1.1 Three or more exits or exit access doorways.

Three exits or exit access doorways shall be provided from any space with an occupant load of 501 to 1,000. Four exits or exit access doorways shall be provided from any space with an occupant load greater than 1,000.

#### 11.6.2.2 Escape based on use.

The numbers of exits or access to exits shall be provided in the uses described in Clauses 11.6.2.2.1 through 11.6.2.2.6.

### 11.6.2.2.1 Boiler, incinerator and furnace rooms.

Two exit access doorways are required in boiler, incinerator and furnace rooms where the area is over 46 m² (500 square feet) and any fuel-fired equipment exceeds 422 000 KJ (400,000 British thermal units (Btu)) input capacity. Where two exit access doorways are required, one is permitted to be a fixed ladder or an alternating tread device. Exit access...
doorways shall be separated by a horizontal distance equal to one-half the length of the maximum overall diagonal dimension of the room.

11.6.2.2 Refrigeration machinery rooms.
Machinery rooms larger than 93 m² (1,000 square feet) shall have not less than two exits or exit access doorways. Where two exit access doorways are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 45 720 mm (150 feet) of an exit or exit access doorway. An increase in exit access travel distance is permitted in accordance with Clause 11.17.1.

Exit and exit access doorways shall swing in the direction of escape travel, regardless of the occupant load served. Exit and exit access doorways shall be tight fitting and self-closing.

11.6.2.2.3 Refrigerated rooms or spaces.
Rooms or spaces having a floor area larger than 93 m² (1,000 square feet), containing a refrigerant evaporator and maintained at a temperature below 20°C (68°F), shall have access to not less than two exits or exit access doorways.

Exit access travel distance shall be determined as specified in Clause 11.17.1, but all portions of a refrigerated room or space shall be within 45 720 mm (150 feet) of an exit or exit access doorway where such rooms are not protected by an approved automatic sprinkler system. Escape is allowed through adjoining refrigerated rooms or spaces.

Exception: Where using refrigerants in quantities limited to the amounts based on the volume set forth in the International Mechanical Code.

11.6.2.2.4 Group I-4 means of Escape.
Group I-4 facilities, rooms or spaces where care is provided for more than 10 children that are 21/2 years of age or less, shall have access to not less than two exits or exit access doorways.

11.6.2.2.5 Vehicular ramps.
Vehicular ramps shall not be considered as an exit access ramp unless pedestrian facilities are provided.

11.6.2.2.6 Groups R-3 and R-4.
Where Group R-3 occupancies are permitted by Clause 10.3.2.8 to be protected by an automatic sprinkler system installed in accordance with Clause 10.3.3.1, the exit access travel distance for Group R-3 shall be not more than 38 100 mm (125 feet). Where Group R-4 occupancies are permitted by Clause 10.3.2.8 to be protected by an automatic sprinkler system installed in accordance with Clause 10.3.3.1, the exit access travel distance for Group R-4 shall be not more than 22 860 mm (75 feet).

11.6.3 Escape from stories or occupied roofs.
The means of escape system serving any storey or occupied roof shall be provided with the number of separate and distinct exits or access to exits based on the aggregate occupant load served in accordance with this Clause. Where stairways serve more than one storey, only the occupant load of each storey considered individually shall be used in calculating the required number of exits or access to exits serving that storey.

11.6.3.1 Adjacent storey.
The path of escape travel to an exit shall not pass through more than one adjacent storey.

Exception: The path of escape travel to an exit shall be permitted to pass through more than one adjacent storey in any of the following:

1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.

2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.

3. Exit access stairways and ramps in open parking garages that serve only the parking garage.
4. Exit access stairways and ramps serving open-air assembly seating complying with the exit access travel distance requirements of Clause 11.29.7.

5. Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.

11.6.3.2 Escape based on occupant load.

Each storey and occupied roof shall have the minimum number of separate and distinct exits, or access to exits, as specified in Table 11.6.3.2. A single exit or access to a single exit shall be permitted in accordance with Clause 11.6.3.3. The required number of exits, or exit access stairways or ramps providing access to exits, from any storey or occupied roof shall be maintained until arrival at the exit discharge or a public way.

</table>

### 11.6.3.3 Single exits.

A single exit or access to a single exit shall be permitted from any storey or occupied roof where one of the following conditions exists:

1. The occupant load, number of dwelling units and common path of escape travel distance do not exceed the values in Table 11.6.3.3(1) or 11.6.3.3(2).

2. Rooms, areas and spaces complying with Clause 11.6.2.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit or access to a single exit.

3. Parking garages where vehicles are mechanically parked shall be permitted to have one exit or access to a single exit.

4. Group R-3 and R-4 occupancies shall be permitted to have one exit or access to a single exit.

5. Individual single-storey or multistorey dwelling units shall be permitted to have a single exit or access to a single exit from the dwelling unit provided that both of the following criteria are met:

   5.1. The dwelling unit complies with Clause 11.6.2.1 as a space with one means of escape.

   5.2. Either the exit from the dwelling unit discharges directly to the exterior at the level of exit discharge, or the exit access outside the dwelling unit’s entrance door provides access to not less than two approved independent exits.

</tbody>
</table>

**Note:** For SI: 1 foot = 304.8 mm.
NP = Not Permitted.
NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 and provided with emergency escape and rescue openings in accordance with Clause 11.30.
- b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 shall have a maximum exit access travel distance of 100 feet.
- c. This table is used for R-2 occupancies consisting of dwelling units. For R-2 occupancies consisting of sleeping units, use Table 11.6.3.3(2).
- d. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

### 11.6.3.3.1 Mixed occupancies.

Where one exit, or exit access stairway or ramp providing access to exits at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 11.6.3.3(1) or 11.6.3.3(2) for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered to be in accordance with the provisions of Clause 11.4.1. In each storey of a mixed occupancy building, the maximum number of occupants served by a single exit shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants indicated in Table 11.6.3.3(2) for each occupancy does not exceed one. Where dwelling units are located on a storey with other occupancies, the actual number of dwelling units divided by four plus the ratio from the other occupancy does not exceed one.

### 11.7 EXIT AND EXIT ACCESS DOORWAY CONFIGURATION

#### 11.7.1 General.

Exits, exit access doorways, and exit access stairways and ramps serving spaces, including individual building stories, shall be separated in accordance with the provisions of this Clause.

#### 11.7.1.1 Two exits or exit access doorways.
Where two exits, exit access doorways, exit access stairways or ramps, or any combination thereof, are required from any portion of the exit access, they shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between them. Interlocking or scissor stairways shall be counted as one exit stairway.

**Exceptions:**

1. Where interior exit stairways or ramps are interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Clause 11.20, the required exit separation shall be measured along the shortest direct line of travel within the corridor.

2. Where a building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2, the separation distance shall be not less than one-third of the length of the maximum overall diagonal dimension of the area served.

**11.7.1.1.1 Measurement point.**

The separation distance required in Clause 11.7.1.1 shall be measured in accordance with the following:

1. The separation distance to exit or exit access doorways shall be measured to any point along the width of the doorway.

2. The separation distance to exit access stairways shall be measured to the closest riser.

3. The separation distance to exit access ramps shall be measured to the start of the ramp run.

**11.7.1.2 Three or more exits or exit access doorways.**

Where access to three or more exits is required, not less than two exit or exit access stairways shall be arranged in accordance with the provisions of Clause 11.7.1.1. Additional required exit or exit access stairways shall be arranged a reasonable distance apart so that if one becomes blocked, the others will be available.

**11.7.1.3 Remoteness of exit access stairways or ramps.**

Where two exit access stairways or ramps provide the required means of escape to exits at another storey, the required separation distance shall be maintained for all portions of such exit access stairways or ramps.

**11.7.1.3.1 Three or more exit access stairways or ramps.**

Where more than two exit access stairways or ramps provide the required means of escape, not less than two shall be arranged in accordance with Clause 11.7.1.3.

**11.8 MEANS OF ESCAPE ILLUMINATION**

**11.8.1 Means of Escape illumination.**

Illumination shall be provided in the means of escape in accordance with Clause 11.8.2. Under emergency power, means of escape illumination shall comply with Clause 11.8.3.

**11.8.2 Illumination required.**

The means of escape serving a room or space shall be illuminated at all times that the room or space is occupied.

**Exceptions:**

1. Occupancies in Group U.

2. Aisle accessways in Group A.

3. Dwelling units and sleeping units in Groups R-1, R-2 and R-3.

4. Sleeping units of Group I occupancies.

**11.8.2.1 Illumination level under normal power.**

The means of escape illumination level shall be not less than 11 lux (1 footcandle) at the walking surface.

**Exception:** For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking
surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' fire alarm system:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 2.15 lux (0.2 footcandle).
2. Steps, landings and the sides of ramps shall be permitted to be marked with self-luminous materials in accordance with Clauses 11.25.2.1, 11.25.2.2 and 11.25.2.4 by systems listed in accordance with this Code.

11.8.2.2 Group I-2.

In Group I-2 occupancies where two or more exits are required, on the exterior landings required by Clause 11.10.1.6, means of escape illumination levels for the exit discharge shall be provided such that failure of a single lamp in a luminaire shall not reduce the illumination level on that landing to less than 11 lux (1 footcandle).

11.8.2.3 Exit discharge.

Illumination shall be provided along the path of travel for the exit discharge from each exit to the public way.

Exception: Illumination shall not be required where the path of the exit discharge meets both of the following requirements:

1. The path of exit discharge is illuminated from the exit to a safe dispersal area complying with Clause 11.28.5.
2. A dispersal area shall be illuminated to a level not less than 11 lux (1 footcandle) at the walking surface.

11.8.3 Emergency power for illumination.

The power supply for means of escape illumination shall normally be provided by the premises' electrical supply.

11.8.3.1 General.

In the event of power supply failure in rooms and spaces that require two or more means of escape, an emergency electrical system shall automatically illuminate all of the following areas:

1. Aisles.
2. Corridors.
3. Exit access stairways and ramps.

11.8.3.2 Buildings.

In the event of power supply failure in buildings that require two or more means of escape, an emergency electrical system shall automatically illuminate all of the following areas:

1. Interior exit access stairways and ramps.
2. Interior and exterior exit stairways and ramps.
3. Exit passageways.
4. Vestibules and areas on the level of discharge used for exit discharge in accordance with Clause 11.28.1.
5. Exterior landings as required by Clause 11.10.1.6 for exit doorways that lead directly to the exit discharge.

11.8.3.3 Rooms and spaces.

In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Electrical equipment rooms.
2. Fire command centres.
3. Fire pump rooms.
4. Generator rooms.
5. Public restrooms with an area greater than 27.87 m² (300 square feet).

11.8.3.4 Duration.

The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Clause 28.13.
11.8.3.5 Illumination level under emergency power.

Emergency lighting facilities shall be arranged to provide initial illumination that is not less than an average of 11 lux (1 footcandle) and a minimum at any point of 1 lux (0.1 footcandle) measured along the path of escape at floor level. Illumination levels shall be permitted to decline to 6 lux (0.6 footcandle) average and a minimum at any point of 0.6 lux (0.06 footcandle) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. In Group I-2 occupancies, failure of a single lamp in a luminaire shall not reduce the illumination level to less than 2.2 lux (0.2 footcandle).

11.9 ACCESSIBLE MEANS OF ESCAPE

11.9.1 Accessible means of Escape required.

Accessible means of escape shall comply with this Clause. Accessible spaces shall be provided with not less than one accessible means of escape. Where more than one means of escape is required by Clause 11.6.2 or 11.6.3 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of escape.

Exceptions:

1. One accessible means of escape is required from an accessible mezzanine level in accordance with Clause 11.9.3, 11.9.4 or 11.9.5.

2. In assembly areas with ramped aisles or stepped aisles, one accessible means of escape is permitted where the common path of escape travel is accessible and meets the requirements in Clause 11.29.8.

11.9.2 Continuity and components.

Each required accessible means of escape shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with this Code.

2. Interior exit stairways complying with Clauses 11.9.3 and 11.23.

3. Exit access stairways complying with Clauses 11.9.3 and 11.19.3 or 11.19.4.

4. Exterior exit stairways complying with Clauses 11.9.3 and 11.27 and serving levels other than the level of exit discharge.

5. Elevators complying with Clause 11.9.4.

6. Platform lifts complying with Clause 11.9.5.

8. Ramps complying with Clause 11.12.

10. Exterior areas for assisted rescue complying with Clause 11.9.7 serving exits at the level of exit discharge.

11.9.2.1 Elevators required.

In buildings where a required accessible floor is four or more stories above or below a level of exit discharge, not less than one required accessible means of escape shall be an elevator complying with Clause 11.9.4.

Exceptions:

1. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2, the elevator shall not be required on floors provided with a horizontal exit and located at or above the levels of exit discharge.

2. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2, the elevator shall not be required on floors provided with a ramp conforming to the provisions of Clause 11.12.

11.9.3 Stairways.

In order to be considered part of an accessible means of escape, a stairway between stories
shall comply with Clauses 11.9.3.1 through 11.9.3.3.

11.9.3.1 Exit access stairways.

Exit access stairways that connect levels in the same storey are not permitted as part of an accessible means of escape.

**Exception:** Exit access stairways providing means of escape from mezzanines are permitted as part of an accessible means of escape.

11.9.3.2 Stairway width.

Stairways shall have a clear width of 1219 mm (48 inches) minimum between handrails.

**Exceptions:**

1. The clear width of 1219 mm (48 inches) between handrails is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

2. The clear width of 1219 mm (48 inches) between handrails is not required for stairways accessed from a refuge area in conjunction with a horizontal exit.

11.9.3.3 Area of refuge.

Stairways shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from an area of refuge complying with Clause 11.9.6.

**Exceptions:**

1. Areas of refuge are not required at exit access stairways where two-way communication is provided at the elevator landing in accordance with Clause 11.9.8.

2. Areas of refuge are not required at stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

3. Areas of refuge are not required at stairways serving open parking garages.

4. Areas of refuge are not required for smoke-protected or open-air assembly seating areas complying with Clauses 11.29.6.2 and 11.29.6.3.

5. Areas of refuge are not required at stairways in Group R-2 occupancies.

6. Areas of refuge are not required for stairways accessed from a refuge area in conjunction with a horizontal exit.

11.9.4 Elevators.

In order to be considered part of an accessible means of escape, an elevator shall comply with Clauses 11.9.4.1 and 11.9.4.2.

11.9.4.1 Standby power.

The elevator shall meet the emergency operation and signaling device requirements of Clause 2.27 of ASME A17.1/CSA B44. Standby power shall be provided in accordance with this Code.

11.9.4.2 Area of refuge.

The elevator shall be accessed from an area of refuge complying with Clause 11.9.6.

**Exceptions:**

1. Areas of refuge are not required at the elevator in open parking garages.

2. Areas of refuge are not required in buildings and facilities equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

3. Areas of refuge are not required at elevators not required to be located in a shaft in accordance with Clause 8.12.

4. Areas of refuge are not required at elevators serving smoke-protected or open-air assembly seating areas complying with Clauses 11.29.6.2 and 11.29.6.3.

5. Areas of refuge are not required for elevators accessed from a refuge area in conjunction with a horizontal exit.
11.9.5 Platform lifts.

Platform lifts shall be permitted to serve as part of an accessible means of escape where allowed as part of a required accessible route in Clause 12.09.8 except for Item 10. Standby power for the platform lift shall be provided in accordance with this Code.

11.9.6 Areas of refuge.

Every required area of refuge shall be accessible from the space it serves by an accessible means of escape.

11.9.6.1 Travel distance.

The maximum travel distance from any accessible space to an area of refuge shall not exceed the exit access travel distance permitted for the occupancy in accordance with Clause 11.17.1.

11.9.6.2 Stairway or elevator access.

Every required area of refuge shall have direct access to a stairway complying with Clauses 11.9.3 and 11.23 or an elevator complying with Clause 11.9.4.

11.9.6.3 Size.

Each area of refuge shall be sized to accommodate one wheelchair space of 762 mm by 1219 mm (30 inches by 48 inches) for each 200 occupants or portion thereof, based on the occupant load of the area of refuge and areas served by the area of refuge. Such wheelchair spaces shall not reduce the means of Escape minimum width or required capacity. Access to any of the required wheelchair spaces in an area of refuge shall not be obstructed by more than one adjoining wheelchair space.

11.9.6.4 Separation.

Each area of refuge shall be separated from the remainder of the storey by a smoke barrier complying with Clause 8.9 or a horizontal exit complying with Clause 11.26. Each area of refuge shall be designed to minimize the intrusion of smoke.

Exceptions:

1. Areas of refuge located within an enclosure for interior exit stairways complying with Clause 11.23.

2. Areas of refuge in outdoor facilities where exit access is essentially open to the outside.

11.9.6.5 Two-way communication.

Areas of refuge shall be provided with a two-way communication system complying with Clauses 11.9.8.1 and 11.9.8.2.

11.9.7 Exterior areas for assisted rescue.

Exterior areas for assisted rescue shall be accessed by an accessible route from the area served.

Where the exit discharge does not include an accessible route from an exit located on the level of exit discharge to a public way, an exterior area of assisted rescue shall be provided on the exterior landing in accordance with Clauses 11.9.7.1 through 11.9.7.4.

11.9.7.1 Size.

Each exterior area for assisted rescue shall be sized to accommodate wheelchair spaces in accordance with Clause 11.9.6.3.

11.9.7.2 Separation.

Exterior walls separating the exterior area of assisted rescue from the interior of the building shall have a minimum fire-resistance rating of 1 hour, rated for exposure to fire from the inside. The fire-resistance-rated exterior wall construction shall extend horizontally not less than 3048 mm (10 feet) beyond the landing on either side of the landing or equivalent fire-resistance-rated construction is permitted to extend out perpendicular to the exterior wall not less than 1220 mm (4 feet) on the side of the landing. The fire-resistance-rated construction shall extend vertically from the ground to a point not less than 3048 mm (10 feet) above the floor level of the area for assisted rescue or to the roof line, whichever is lower. Openings within such fire-resistance-rated exterior walls shall be protected in accordance with Clause 8.16.

Exception: The fire-resistance rating and opening protectives are not required in the exterior wall where the building is equipped
throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

11.9.7.3 Openness.

The exterior area for assisted rescue shall be open to the outside air. The sides other than the separation walls shall be not less than 50 percent open, and the open area shall be distributed so as to minimize the accumulation of smoke or toxic gases.

11.9.7.4 Stairways.

Stairways that are part of the means of escape for the exterior area for assisted rescue shall provide a minimum clear width of 1220 mm (48 inches) between handrails.

Exception: The minimum clear width of 1220 mm (48 inches) between handrails is not required at stairways serving buildings equipped with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

11.9.8 Two-way communication.

A two-way communication system complying with Clauses 11.9.8.1 and 11.9.8.2 shall be provided at the landing serving each elevator or bank of elevators on each accessible floor that is one or more stories above or below the level of exit discharge.

Exceptions:

1. Two-way communication systems are not required at the landing serving each elevator or bank of elevators where the two-way communication system is provided within areas of refuge in accordance with Clause 11.9.6.5.

2. Two-way communication systems are not required on floors provided with ramps conforming to the provisions of Clause 11.12.

3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible means of escape or serve as part of the required accessible route into a facility.

4. Two-way communication systems are not required at the landings serving only freight elevators.

5. Two-way communication systems are not required at the landing serving a private residence elevator.

6. Two-way communication systems are not required in Group I-2 or I-3 facilities.

11.9.8.1 System requirements.

Two-way communication systems shall provide communication between each required location and the fire command center or a central control point location approved by the fire department. Where the central control point is not a constantly attended location, a two-way communication system shall have a timed automatic telephone dial-out capability to a monitoring location or 9-1-1. The two-way communication system shall include both audible and visible signals.

11.9.8.2 Directions.

Directions for the use of the two-way communication system, instructions for summoning assistance via the two-way communication system and written identification of the location shall be posted adjacent to the two-way communication system. Signage shall comply with the ICC A117.1 requirements for visual characters.

11.9.9 Signage.

Signage indicating special accessibility provisions shall be provided as shown:

1. Each door providing access to an area of refuge from an adjacent floor area shall be identified by a sign stating: AREA OF REFUGE.

2. Each door providing access to an exterior area for assisted rescue shall be identified by a sign stating: EXTERIOR AREA FOR ASSISTED RESCUE.

Signage shall comply with the ICC A117.1 requirements for visual characters and include the International Symbol of Accessibility.
exit sign illumination is required by Clause 11.13.3, the signs shall be illuminated. Additionally, visual characters, raised character and braille signage complying with ICC A117.1 shall be located at each door to an area of refuge and exterior area for assisted rescue in accordance with Clause 11.13.4.

11.9.10 Directional signage.
Directional signage indicating the location of all other means of escape and which of those are accessible means of escape shall be provided at the following:
1. At exits serving a required accessible space but not providing an approved accessible means of escape.
2. At elevator landings.
3. Within areas of refuge.

11.9.11 Instructions.
In areas of refuge and exterior areas for assisted rescue, instructions on the use of the area under emergency conditions shall be posted. Signage shall comply with the ICC A117.1 requirements for visual characters. The instructions shall include all of the following:
1. Persons able to use the exit stairway do so as soon as possible, unless they are assisting others.
2. Information on planned availability of assistance in the use of stairs or supervised operation of elevators and how to summon such assistance.
3. Directions for use of the two-way communication system where provided.

11.10 DOORS, GATES AND TURNSTILES

11.10.1 Doors.
Means of escape doors shall meet the requirements of this Clause. Doors serving a means of escape system shall meet the requirements of this Clause and Clause 11.22.2. Doors provided for escape purposes in numbers greater than required by this Code shall meet the requirements of this Clause.

Means of escape doors shall be readily distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Mirrors or similar reflecting materials shall not be used on means of escape doors. Means of escape doors shall not be concealed by curtains, drapes, decorations or similar materials.

11.10.1.1 Size of doors.
The required capacity of each door opening shall be sufficient for the occupant load thereof and shall provide a minimum clear opening width of 813 mm (32 inches). The clear opening width of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this Clause requires a minimum clear opening width of 813 mm (32 inches) and a door opening includes two door leaves without a mullion, one leaf shall provide a minimum clear opening width of 813 mm (32 inches) and a door opening includes two door leaves without a mullion, one leaf shall provide a minimum clear opening width of 813 mm (32 inches). In Group I-2, doors serving as means of escape where used for the movement of beds shall provide a minimum clear opening width of 1054 mm (41 1/2 inches). The maximum width of a swinging door leaf shall be 1219 mm (48 inches) nominal. The minimum clear opening height of doors shall be not less than 2032 mm (80 inches).

Exceptions:
1. In Group R-2 and R-3 dwelling and sleeping units that are not required to be an Accessible unit, Type A unit or Type B unit, the minimum and maximum width shall not apply to door openings that are not part of the required means of escape.
2. In Group I-3, door openings to resident sleeping units that are not required to be an Accessible unit shall have a minimum clear opening width of 711 mm (28 inches).
3. Door openings to storage closets less than 0.93 m2 (10 square feet) in area shall not be limited by the minimum clear opening width.
4. The width of door leaves in revolving doors that comply with Clause 11.10.1.4.1 shall not be limited.
5. The maximum width of door leaves in power-operated doors that comply
with Clause 11.10.1.4.2 shall not be limited.

6. Door openings within a dwelling unit or sleeping unit shall have a minimum clear opening height of 1981 mm (78 inches).

7. In dwelling and sleeping units that are not required to be Accessible, Type A or Type B units, exterior door openings other than the required exit door shall have a minimum clear opening height of 1930 mm (76 inches).

8. In Groups I-1, R-2, R-3 and R-4, in dwelling and sleeping units that are not required to be Accessible, Type A or Type B units, the minimum clear opening widths shall not apply to interior escape doors.

9. Door openings required to be accessible within Type B units intended for user passage shall have a minimum clear opening width of 806 mm (31.75 inches).

10. Doors to walk-in freezers and coolers less than 93 m2 (1,000 square feet) in area shall have a maximum width of 1524 mm (60 inches) nominal.

11. The minimum clear opening width shall not apply to doors for nonaccessible shower or sauna compartments.

12. The minimum clear opening width shall not apply to the doors for nonaccessible toilet stalls.

### 11.10.1.2 Door swing.

Escape doors shall be of the pivoted or side-hinged swinging type.

**Exceptions:**

1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.

2. Group I-3 occupancies used as a place of detention.

3. Critical or intensive care patient rooms within suites of health care facilities.

4. Doors within or serving a single dwelling unit in Groups R-2 and R-3.

5. In other than Group H occupancies, revolving doors complying with Clause 11.10.1.4.1.

6. In other than Group H occupancies, special purpose horizontal sliding, accordion or folding door assemblies complying with Clause 11.10.1.4.3.

7. Power-operated doors in accordance with Clause 11.10.1.4.2.

8. Doors serving a bathroom within an individual sleeping unit in Group R-1.

9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a means of Escape from spaces with an occupant load of 10 or less.

#### 11.10.1.1.1 Projections into clear width.

There shall not be projections into the required clear opening width lower than 864 mm (34 inches) above the floor or ground. Projections into the clear opening width between 864 mm (34 inches) and 2032 mm (80 inches) above the floor or ground shall not exceed 102 mm (4 inches).

**Exception:** Door closers and door stops shall be permitted to be 1980 mm (78 inches) minimum above the floor.

#### 11.10.1.2 Direction of swing.

Pivot or side-hinged swinging doors shall swing in the direction of Escape travel where serving a room or area containing an occupant load of 50 or more persons or a Group H occupancy.

#### 11.10.1.3 Door opening force.

The force for pushing or pulling open interior swinging Escape doors, other than fire doors, shall not exceed 22 N (5 pounds). These forces do not apply to the force required to retract latch bolts or disengage other devices that hold the door in a closed position. For other swinging doors, as well as sliding and folding doors, the door latch shall release when subjected to a 67 N (15-pound) force. The door shall be set in motion when subjected to a 133
N (30-pound) force. The door shall swing to a full-open position when subjected to a 67 N (15-pound) force.

11.10.1.3.1 Location of applied forces.

Forces shall be applied to the latch side of the door.

11.10.1.4 Special doors.

Special doors and security grilles shall comply with the requirements of Clauses 11.10.1.4.1 through 11.10.1.4.5.

11.10.1.4.1 Revolving doors.

Revolving doors shall comply with the following:

1. Revolving doors shall comply with this Code and shall be installed in accordance with the manufacturer’s instructions.

2. Each revolving door shall be capable of breakout in accordance with this Code and shall provide an aggregate width of not less than 914 mm (36 inches).

3. A revolving door shall not be located within 3048 mm (10 feet) of the foot or top of stairways or escalators. A dispersal area shall be provided between the stairways or escalators and the revolving doors.

4. The revolutions per minute (rpm) for a revolving door shall not exceed the maximum rpm as specified in this Code. Manual revolving doors shall comply with Table 11.10.1.4.1(1). Automatic or power-operated revolving doors shall comply with Table 11.10.1.4.1(2).

5. An emergency stop switch shall be provided near each entry point of power or automatic operated revolving doors within 48 inches (1220 mm) of the door and between 610 mm (24 inches) and 1220 mm (48 inches) above the floor. The activation area of the emergency stop switch button shall be not less than 25 mm (1 inch) in diameter and shall be red.

6. Each revolving door shall have a side-hinged swinging door that complies with Clause 11.10.1 in the same wall and within 3048 mm (10 feet) of the revolving door.

7. Revolving doors shall not be part of an accessible route required by Clause 11.9 and Part 12.

Note: For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

11.10.1.4.1.1 Escape component.

A revolving door used as a component of a means of escape shall comply with Clause 11.10.1.4.1 and the following three conditions:
1. Revolving doors shall not be given credit for more than 50 percent of the minimum width or required capacity.

2. Each revolving door shall be credited with a capacity based on not more than a 50-person occupant load.

3. Each revolving door shall provide for Escape in accordance with this Code, with a breakout force of not more than 578 N (130 pounds).

11.10.1.4.1.2 Other than Escape component.

A revolving door used as other than a component of a means of escape shall comply with Clause 11.10.1.4.1. The breakout force of a revolving door not used as a component of a means of escape shall not be more than 801 N (180 pounds).

Exception: A breakout force in excess of 801 N (180 pounds) is permitted if the breakout force is reduced to not more than 578 N (130 pounds) when not less than one of the following conditions is satisfied:

1. There is a power failure or power is removed to the device holding the door wings in position.

2. There is an actuation of the automatic sprinkler system where such system is provided.

3. There is an actuation of a smoke detection system that is installed in accordance with Clause 10.7 to provide coverage in areas within the building that are within 22860 mm (75 feet) of the revolving doors.

4. There is an actuation of a manual control switch, in an approved location and clearly identified, that reduces the breakout force to not more than 578 N (130 pounds).

11.10.1.4.2 Power-operated doors.

Where means of escape doors are operated or assisted by power, the design shall be such that in the event of power failure, the door is capable of being opened manually to permit means of escape travel or closed where necessary to safeguard means of escape. The forces required to open these doors manually shall not exceed those specified in Clause 11.10.1.3, except that the force to set the door in motion shall not exceed 220 N (50 pounds). The door shall be capable of opening from any position to the full width of the opening in which such door is installed when a force is applied to the door on the side from which escape is made. Power-operated swinging doors, power-operated sliding doors and power-operated folding doors shall comply with this code. Power-assisted swinging doors and low-energy power-operated swinging doors shall comply with this Code. Low-energy power-operated sliding doors and low-energy power-operated folding doors shall comply with this Code.

Exceptions:

1. Occupancies in Group I-3.

2. Special purpose horizontal sliding, accordion or folding doors complying with Clause 11.10.1.4.3.

3. For a biparting door in the emergency breakout mode, a door leaf located within a multiple-leaf opening shall be exempt from the minimum 813 mm (32-inch) single-leaf requirement of Clause 11.10.1.1, provided that a minimum 813 mm (32-inch) clear opening is provided when the two biparting leaves meeting in the center are broken out.

11.10.1.4.3 Special purpose horizontal sliding, accordion or folding doors.

In other than Group H occupancies, special purpose horizontal sliding, accordion or folding door assemblies permitted to be a component of a means of escape in accordance with Exception 6 to Clause 11.10.1.2 shall comply with all of the following criteria:

1. The doors shall be powered operated and shall be capable of being operated manually in the event of power failure.

2. The doors shall be openable by a simple method from both sides without special knowledge or effort.

3. The force required to operate the door shall not exceed 133 N (30 pounds) to set the door in motion and 67 N (15 pounds) to close the door or open it to the minimum required width.
4. The door shall be openable with a force not to exceed 67 N (15 pounds) when a force of 1100 N (250 pounds) is applied perpendicular to the door adjacent to the operating device.

5. The door assembly shall comply with the applicable fire protection rating and, where rated, shall be self-closing or automatic closing by smoke detection in accordance with Clause 8.16.2.6.6, shall be installed in accordance with the Ghana Fire Code and shall comply with Clause 8.16.

6. The door assembly shall have an integrated standby power supply.

7. The door assembly power supply shall be electrically supervised.

8. The door shall open to the minimum required width within 10 seconds after activation of the operating device.

11.10.1.4.4 Locking arrangements in educational occupancies.

In Group E and Group B educational occupancies, escape doors from classrooms, offices and other occupied rooms shall be permitted to be provided with locking arrangements designed to keep intruders from entering the room where all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.

2. The door shall be openable from within the room in accordance with Clause 11.10.1.9.

3. Modifications shall not be made to listed panic hardware, fire door hardware or door closers.

11.10.1.4.4.1 Remote operation of locks.

Remote operation of locks complying with Clause 11.10.1.4.4 shall be permitted.

11.10.1.4.5 Security grilles.

In Groups B, F, M and S, horizontal sliding or vertical security grilles are permitted at the main exit and shall be openable from the inside without the use of a key or special knowledge or effort during periods that the space is occupied. The grilles shall remain secured in the full-open position during the period of occupancy by the general public. Where two or more means of escape are required, not more than one-half of the exits or exit access doorways shall be equipped with horizontal sliding or vertical security grilles.

11.10.1.5 Floor elevation.

There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope).

Exceptions:

1. Doors serving individual dwelling units in Groups R-2 and R-3 where the following apply:

   1.1. A door is permitted to open at the top step of an interior flight of stairs, provided that the door does not swing over the top step.

   1.2. Screen doors and storm doors are permitted to swing over stairs or landings.

2. Exterior doors as provided for in Clause 11.3.5, Exception 1, and Clause 11.22.2, which are not on an accessible route.

3. In Group R-3 occupancies not required to be Accessible units, Type A units or Type B units, the landing at an exterior doorway shall be not more than 73/4 inches (197 mm) below the top of the threshold, provided the door, other than an exterior storm or screen door, does not swing over the landing.

4. Variations in elevation due to differences in finish materials, but not more than 12.7 mm (1/2 inch).

5. Exterior decks, patios or balconies that are part of Type B dwelling units, have impervious surfaces and that are not more than 102 mm (4
inches) below the finished floor level of the adjacent interior space of the dwelling unit.

6. Doors serving equipment spaces not required to be accessible in accordance with Clause 12.03.2.9 and serving an occupant load of five or less shall be permitted to have a landing on one side to be not more than 178 mm (7 inches) above or below the landing on the escape side of the door.

11.10.1.6 Landings at doors.

Landings shall have a width not less than the width of the stairway or the door, whichever is greater. Doors in the fully open position shall not reduce a required dimension by more than 178 mm (7 inches). Where a landing serves an occupant load of 50 or more, doors in any position shall not reduce the landing to less than one-half its required width. Landings shall have a length measured in the direction of travel of not less than 1118 mm (44 inches).

Exception: Landing length in the direction of travel in Groups R-3 and U and within individual units of Group R-2 need not exceed 914 mm (36 inches).

11.10.1.7 Thresholds.

Thresholds at doorways shall not exceed 19.1 mm (3/4 inch) in height above the finished floor or landing for sliding doors serving dwelling units or 12.7 mm (1/2 inch) above the finished floor or landing for other doors. Raised thresholds and floor level changes greater than 6.4 mm (1/4 inch) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope).

Exceptions:

1. In occupancy Group R-2 or R-3, threshold heights for sliding and side-hinged exterior doors shall be permitted to be up to 197 mm (73/4 inches) in height if all of the following apply:

1.1. The door is not part of the required means of escape.

1.2. The door is not part of an accessible route as required by Part 12.

1.3. The door is not part of an Accessible unit, Type A unit or Type B unit.

2. In Type B units, where Exception 5 to Clause 11.10.1.5 permits a 102 mm (4-inch) elevation change at the door, the threshold height on the exterior side of the door shall not exceed 120 mm (43/4 inches) in height above the exterior deck, patio or balcony for sliding doors or 114 mm (41/2 inches) above the exterior deck, patio or balcony for other doors.

11.10.1.8 Door arrangement.

Space between two doors in a series shall be 1219 mm (48 inches) minimum plus the width of a door swinging into the space. Doors in a series shall swing either in the same direction or away from the space between the doors.

Exceptions:

1. The minimum distance between horizontal sliding power-operated doors in a series shall be 1219 mm (48 inches).

2. Storm and screen doors serving individual dwelling units in Groups R-2 and R-3 need not be spaced 1219 mm (48 inches) from the other door.

3. Doors within individual dwelling units in Groups R-2 and R-3 other than within Type A dwelling units.

11.10.1.9 Door operations.

Except as specifically permitted by this Clause, Escape doors shall be readily openable from the Escape side without the use of a key or special knowledge or effort.

11.10.1.9.1 Hardware.

Door handles, pulls, latches, locks and other operating devices on doors required to be accessible by Part 12 shall not require tight grasping, tight pinching or twisting of the wrist to operate.
11.10.1.9.2 Hardware height.

Door handles, pulls, latches, locks and other operating devices shall be installed 864 mm (34 inches) minimum and 1219 mm (48 inches) maximum above the finished floor. Locks used only for security purposes and not used for normal operation are permitted at any height.

Exception: Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to have operable parts of the latch release on self-latching devices at 1370 mm (54 inches) maximum above the finished floor or ground, provided that the self-latching devices are not also self-locking devices operated by means of a key, electronic opener or integral combination lock.

11.10.1.9.3 Monitored or recorded Escape.

Where electrical systems that monitor or record Escape activity are incorporated, the locking system shall comply with Clause 11.10.1.9.7, 11.10.1.9.8, 11.10.1.9.9, 11.10.1.9.10 or 11.10.1.9.11 or shall be readily openable from the Escape side without the use of a key or special knowledge or effort.

11.10.1.9.4 Locks and latches.

Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.

2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main door or doors are permitted to be equipped with key-operated locking devices from the Escape side provided:

   2.1. The locking device is readily distinguishable as locked.

   2.2. A readily visible durable sign is posted on the Escape side on or adjacent to the door stating: THIS DOOR TO REMAIN_UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.

2.3. The use of the key-operated locking device is revocable by the building official for due cause.

3. Where Escape doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.

4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.

5. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.

6. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the building from the roof.

1. 11.10.1.9.5 Bolt locks.

2. Manually operated flush bolts or surface bolts are not permitted.

Exceptions:

1. On doors not required for escape in individual dwelling units or sleeping units.

2. Where a pair of doors serves a storage or equipment room, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf.

3. Where a pair of doors serves an occupant load of less than 50 persons in a Group B, F or S occupancy, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf. The inactive leaf shall not contain doorknobs, panic bars or similar operating hardware.

4. Where a pair of doors serves a Group B, F or S occupancy, manually
operated edge- or surface-mounted bolts are permitted on the inactive leaf provided that such inactive leaf is not needed to meet Escape capacity requirements and the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1. The inactive leaf shall not contain doorknobs, panic bars or similar operating hardware.

5. Where a pair of doors serves patient care rooms in Group I-2 occupancies, self-latching edge- or surface-mounted bolts are permitted on the inactive leaf provided that the inactive leaf is not needed to meet Escape capacity requirements and the inactive leaf shall not contain doorknobs, panic bars or similar operating hardware.

11.10.1.9.6 Unlatching.

The unlatching of any door or leaf shall not require more than one operation.

Exceptions:

1. Places of detention or restraint.
2. Where manually operated bolt locks are permitted by Clause 11.10.1.9.5.
3. Doors with automatic flush bolts as permitted by Clause 11.10.1.9.4, Item 3.
4. Doors from individual dwelling units and sleeping units of Group R occupancies as permitted by Clause 11.10.1.9.4, Item 4.

11.10.1.9.6.1 Closet doors.

Closet doors that latch in the closed position shall be openable from inside the closet.

11.10.1.9.7 Controlled Escape doors in Groups I-1 and I-2.

Electric locking systems, including electromagnetic locking systems, shall be permitted to be locked in the means of Escape in Group I-1 or I-2 occupancies where the clinical needs of persons receiving care require their containment. Controlled Escape doors shall be permitted in such occupancies where the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or an approved automatic smoke or heat detection system installed in accordance with Clause 10.7, provided that the doors are installed and operate in accordance with all of the following:

1. The door locks shall unlock on actuation of the automatic sprinkler system or automatic fire detection system.
2. The door locks shall unlock on loss of power controlling the lock or lock mechanism.
3. The door locking system shall be installed to have the capability of being unlocked by a switch located at the fire command center, a nursing station or other approved location. The switch shall directly break power to the lock.
4. A building occupant shall not be required to pass through more than one door equipped with a controlled Escape locking system before entering an exit.
5. The procedures for unlocking the doors shall be described and approved as part of the emergency planning and preparedness required by the Ghana Fire Code.
6. All clinical staff shall have the keys, Codes or other means necessary to operate the locking systems.
7. Emergency lighting shall be provided at the door.
8. The door locking system units shall be listed in accordance with this Code.

Exceptions:

1. Items 1 through 4 shall not apply to doors to areas occupied by persons who, because of clinical needs, require restraint or containment as part of the function of a psychiatric treatment area.
2. Items 1 through 4 shall not apply to doors to areas where a listed Escape control system is utilized to reduce the risk of child abduction from nursery and obstetric areas of a Group I-2 hospital.

11.10.1.9.8 Delayed Escape.

Delayed Escape locking systems shall be permitted to be installed on doors serving the following occupancies in buildings that are equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or an approved automatic smoke or heat detection system installed in accordance with Clause 10.7.

2. Group E classrooms with an occupant load of less than 50.

Exception: Delayed Escape locking systems shall be permitted to be installed on exit or exit access doors, other than the main exit or exit access door, serving a courtroom in buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

11.10.1.9.8.1 Delayed Escape locking system.

The delayed escape locking system shall be installed and operated in accordance with all of the following:

1. The delay electronics of the delayed escape locking system shall deactivate upon actuation of the automatic sprinkler system or automatic fire detection system, allowing immediate free escape.
2. The delay electronics of the delayed escape locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free Escape.
3. The delayed escape locking system shall have the capability of being deactivated at the fire command center and other approved locations.

4. An attempt to escape shall initiate an irreversible process that shall allow such escape in not more than 15 seconds when a physical effort to exit is applied to the escape side door hardware for not more than 3 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.

Exception: Where approved, a delay of not more than 30 seconds is permitted on a delayed Escape door.

5. The Escape path from any point shall not pass through more than one delayed Escape locking system.

Exceptions:

1. In Group I-2 or I-3 occupancies, the Escape path from any point in the building shall pass through not more than two delayed Escape locking systems provided that the combined delay does not exceed 30 seconds.
2. In Group I-1 or I-4 occupancies, the Escape path from any point in the building shall pass through not more than two delayed Escape locking systems provided the combined delay does not exceed 30 seconds and the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:

6.1. For doors that swing in the direction of Escape, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.

6.2. For doors that swing in the opposite direction of escape, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
6.3. The sign shall comply with the visual character requirements in ICC A117.1.

**Exception:** Where approved, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.

7. Emergency lighting shall be provided on the escape side of the door.

8. The delayed Escape locking system units shall be listed in accordance with this Code.

### 11.10.1.9.9 Sensor release of electrically locked Escape doors.

Sensor release of electric locking systems shall be permitted on doors located in the means of escape in any occupancy except Group H where installed and operated in accordance with all of the following criteria:

1. The sensor shall be installed on the escape side, arranged to detect an occupant approaching the doors, and shall cause the electric locking system to unlock.

2. The electric locks shall be arranged to unlock by a signal from or loss of power to the sensor.

3. Loss of power to the lock or locking system shall automatically unlock the electric locks.

4. The doors shall be arranged to unlock from a manual unlocking device located 11.16 mm to 1219 mm (40 inches to 48 inches) vertically above the floor and within 1524 mm (5 feet) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads “PUSH TO EXIT.” When operated, the manual unlocking device shall result in direct interruption of power to the electric lock—-independent of other electronics—and the electric lock shall remain unlocked for not less than 30 seconds.

5. Activation of the building fire alarm system, where provided, shall automatically unlock the electric lock, and the electric lock shall remain unlocked until the fire alarm system has been reset.

6. Activation of the building automatic sprinkler system or fire detection system, where provided, shall automatically unlock the electric lock. The electric lock shall remain unlocked until the fire alarm system has been reset.

7. The door locking system units shall be listed in accordance with this Code.

### 11.10.1.9.10 Door hardware release of electrically locked escape doors.

Door hardware release of electric locking systems shall be permitted on doors in the means of escape in any occupancy except Group H where installed and operated in accordance with all of the following:

1. The door hardware that is affixed to the door leaf has an obvious method of operation that is readily operated under all lighting conditions.

2. The door hardware is capable of being operated with one hand and shall comply with Clause 11.10.1.9.6.

3. Operation of the door hardware directly interrupts the power to the electric lock and unlocks the door immediately.

4. Loss of power to the electric locking system automatically unlocks the door.

5. Where panic or fire exit hardware is required by Clause 11.10.1.10, operation of the panic or fire exit hardware also releases the electric lock.

6. The locking system units shall be listed in accordance with this Code.

### 11.10.1.9.11 Locking arrangements in buildings within correctional facilities.

In buildings within correctional and detention facilities, doors in means of Escape serving rooms or spaces occupied by persons whose movements are controlled for security reasons shall be permitted to be locked where equipped
with Escape control devices that shall unlock manually and by not less than one of the following means:

1. Activation of an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1.
2. Activation of an approved manual fire alarm box.
3. A signal from a constantly attended location.

11.10.1.9.12 Stairway doors.

Interior stairway means of Escape doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. Stairway discharge doors shall be openable from the Escape side and shall only be locked from the opposite side.
2. This Clause shall not apply to doors arranged in accordance with Clause 4.3.5.3.
3. Stairway exit doors are permitted to be locked from the side opposite the escape side, provided that they are openable from the escape side and capable of being unlocked simultaneously without unlatching upon a signal from the fire command center, if present, or a signal by emergency personnel from a single location inside the main entrance to the building.
4. Stairway exit doors shall be openable from the escape side and shall only be locked from the opposite side in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single exit stairway where permitted in Clause 11.6.3.3.

11.10.1.10 Panic and fire exit hardware.

Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an occupant load of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than panic hardware or fire exit hardware.

Exceptions:

1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Clause 11.10.1.9.4, Item 2.
2. Doors provided with panic hardware or fire exit hardware and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Clause 11.10.1.9.9 or 11.10.1.9.10.

Electrical rooms with equipment rated 1,200 amperes or more and over 1829 mm (6 feet) wide, and that contain overcurrent devices, switching devices or control devices with exit or exit access doors, shall be equipped with panic hardware or fire exit hardware. The doors shall swing in the direction of escape travel.

11.10.1.10.1 Installation.

Where panic or fire exit hardware is installed, it shall comply with the following:

1. Panic hardware shall be listed in accordance with this Code.
2. Fire exit hardware shall be listed in accordance with this Code.
3. The actuating portion of the releasing device shall extend not less than one-half of the door leaf width.
4. The maximum unlatching force shall not exceed 67 N (15 pounds).

11.10.1.10.2 Balanced doors.

If balanced doors are used and panic hardware is required, the panic hardware shall be the push-pad type and the pad shall not extend more than one-half the width of the door measured from the latch side.
11.10.2 Gates.

Gates serving the means of escape system shall comply with the requirements of this Clause. Gates used as a component in a means of escape shall conform to the applicable requirements for doors.

Exception: Horizontal sliding or swinging gates exceeding the 1219 mm (4-foot) maximum leaf width limitation are permitted in fences and walls surrounding a stadium.

11.10.2.1 Stadiums.

Panic hardware is not required on gates surrounding stadiums where such gates are under constant immediate supervision while the public is present, and where safe dispersal areas based on 0.28 m² (3 square feet) per occupant are located between the fence and enclosed space. Such required safe dispersal areas shall not be located less than 15 240 mm (50 feet) from the enclosed space. See Clause 11.28.5 for means of Escape from safe dispersal areas.

11.10.3 Turnstiles and similar devices.

Turnstiles or similar devices that restrict travel to one direction shall not be placed so as to obstruct any required means of escape, except where permitted in accordance with Clauses 11.10.3.1, 11.10.3.2 and 11.10.3.3.

11.10.3.1 Capacity.

Each turnstile or similar device shall be credited with a capacity based on not more than a 50-person occupant load where all of the following provisions are met:

1. Each device shall turn free in the direction of escape travel when primary power is lost and on the manual release by an employee in the area.
2. Such devices are not given credit for more than 50 percent of the required escape capacity or width.
3. Each device is not more than 991 mm (39 inches) high.
4. Each device has not less than 419 mm (161/2 inches) clear width at and below a height of 991 mm (39 inches) and not less than 559 mm (22 inches) clear width at heights above 991 mm (39 inches).

11.10.3.1.1 Clear width.

Where located as part of an accessible route, turnstiles shall have not less than 914 mm (36 inches) clear at and below a height of 864 mm (34 inches), not less than 813 mm (32 inches) clear width between 864 mm (34 inches) and 2032 mm (80 inches) and shall consist of a mechanism other than a revolving device.

11.10.3.2 Security access turnstiles.

Security access turnstiles that inhibit travel in the direction of escape utilizing a physical barrier shall be permitted to be considered as a component of the means of escape, provided that all of the following criteria are met:

1. The building is protected throughout by an automatic sprinkler system in accordance with Clause 10.3.3.1.1.
2. Each security access turnstile lane configuration has a minimum clear passage width of 559 mm (22 inches).
3. Any security access turnstile lane configuration providing a clear passage width of less than 810 mm (32 inches) shall be credited with a maximum escape capacity of 50 persons.
4. Any security access turnstile lane configuration providing a clear passage width of 810 mm (32 inches) or more shall be credited with a maximum escape capacity as calculated in accordance with Clause 11.5.
5. Each secured physical barrier shall automatically retract or swing to an unobstructed open position in the direction of escape, under each of the following conditions:

5.1. Upon loss of power to the turnstile or any part of the access control system that secures the physical barrier.
5.2. Upon actuation of a clearly identified manual release device with ready access that results in direct interruption of power to each
secured physical barrier, after which such barriers remain in the open position for not less than 30 seconds. The manual release device shall be positioned at one of the following locations:

5.2.1. On the escape side of each security access turnstile lane.

5.2.2. At an approved location where it can be actuated by an employee assigned to the area at all times that the building is occupied.

5.3. Upon actuation of the building fire alarm system, if provided, after which the physical barrier remains in the open position until the fire alarm system is manually reset.

**Exception:** Actuation of a manual fire alarm box.

5.4. Upon actuation of the building automatic sprinkler or fire detection system, after which the physical barrier remains in the open position until the fire alarm system is manually reset.

11.10.3.3 High turnstile.

Turnstiles more than 991 mm (39 inches) high shall meet the requirements for revolving doors or the requirements of Clause 11.10.3.2 for security access turnstiles.

11.10.3.4 Additional door.

Where serving an occupant load greater than 300, each turnstile that is not portable shall have a side-hinged swinging door that conforms to Clause 11.10.1 within 15 240 mm (50 feet).

**Exception:** A side-hinged swinging door is not required at security access turnstiles that comply with Clause 11.10.3.2

11.11 STAIRWAYS

11.11.1 General.

Stairways serving occupied portions of a building shall comply with the requirements of Clauses 11.11.2 through 11.11.13. Alternating tread devices shall comply with Clause 11.11.14. Ships ladders shall comply with Clause 11.11.15. Ladders shall comply with Clause 11.11.16.

**Exception:** Within rooms or spaces used for assembly purposes, stepped aisles shall comply with Clause 11.29.

11.11.2 Width and capacity.

The required capacity of stairways shall be determined as specified in Clause 11.5.1, but the minimum width shall be not less than 1118 mm (44 inches). See Clause 11.9.3 for accessible means of escape stairways.

**Exceptions:**

1. Stairways serving an occupant load of less than 50 shall have a width of not less than 914 mm (36 inches).

2. Spiral stairways as provided for in Clause 11.11.10.

3. Where an incline platform lift or stairway chairlift is installed on stairways serving occupancies in Group R-3, or within dwelling units in occupancies in Group R-2, a clear passage width not less than 508 mm (20 inches) shall be provided. Where the seat and platform can be folded when not in use, the distance shall be measured from the folded position.

11.11.3 Headroom.

Stairways shall have a headroom clearance of not less than 2032 mm (80 inches) measured vertically from a line connecting the edge of the nosings. Such headroom shall be continuous above the stairway to the point where the line intersects the landing below, one tread depth beyond the bottom riser. The minimum clearance shall be maintained the full width of the stairway and landing.

**Exceptions:**

1. Spiral stairways complying with Clause 11.11.10 are permitted a 1981 mm (78-inch) headroom clearance.

2. In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or...
accessory to individual dwelling units in Group R-2 occupancies; where the nosings of treads at the side of a flight extend under the edge of a floor opening through which the stair passes, the floor opening shall be allowed to project horizontally into the required headroom not more than 121 mm (43/4 inches).

11.11.4 Walkline.

The walkline across winder treads shall be concentric to the direction of travel through the turn and located 12 inches (305 mm) from the side where the winders are narrower. The 12-inch (305 mm) dimension shall be measured from the widest point of the clear stair width at the walking surface of the winder. Where winders are adjacent within the flight, the point of the widest clear stair width of the adjacent winders shall be used.

11.11.5 Stair treads and risers.

Stair treads and risers shall comply with Clauses 11.11.5.1 through 11.11.5.3.

11.11.5.1 Dimension reference surfaces.

For the purpose of this Clause, all dimensions are exclusive of carpets, rugs or runners.

11.11.5.2 Riser height and tread depth.

Stair riser heights shall be 178 mm (7 inches) maximum and 102 mm (4 inches) minimum. The riser height shall be measured vertically between the nosings of adjacent treads. Rectangular tread depths shall be 279 mm (11 inches) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread’s nosing. Winder treads shall have a minimum tread depth of 279 mm (11 inches) between the vertical planes of the foremost projection of adjacent treads at the interClauses with the walkline and a minimum tread depth of 254 mm (10 inches) within the clear width of the stair.

Exceptions:

1. Spiral stairways in accordance with Clause 11.11.10.

2. Stairways connecting stepped aisles to cross aisles or concourses shall be permitted to use the riser/tread dimension in Clause 11.29.14.2.

3. In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; the maximum riser height shall be 197 mm (73/4 inches); the minimum tread depth shall be 254 mm (10 inches); the minimum winder tread depth at the walkline shall be 254 mm (10 inches); and the minimum winder tread depth shall be 152 mm (6 inches). A nosing projection not less than 19.1 mm (3/4 inch) but not more than 32 mm (11/4 inches) shall be provided on stairways with solid risers where the tread depth is less than 279 mm (11 inches).

4. See this Code for the replacement of existing stairways.

5. In Group I-3 facilities, stairways providing access to guard towers, observation stations and control rooms, not more than 23 m2 (250 square feet) in area, shall be permitted to have a maximum riser height of 203 mm (8 inches) and a minimum tread depth of 229 mm (9 inches).

11.11.5.3 Winder treads.

Winder treads are not permitted in means of escape stairways except within a dwelling unit.

Exceptions:

1. Curved stairways in accordance with Clause 11.11.9.

2. Spiral stairways in accordance with Clause 11.11.10.

11.11.5.4 Dimensional uniformity.

Stair treads and risers shall be of uniform size and shape. The tolerance between the largest and smallest riser height or between the largest and smallest tread depth shall not exceed 9.5 mm (3/8 inch) in any flight of stairs. The greatest winder tread depth at the walkline within any flight of stairs shall not exceed the smallest by more than 9.5 mm (3/8 inch).
Exceptions:

1. Stairways connecting stepped aisles to cross aisles or concourses shall be permitted to comply with the dimensional nonuniformity in Clause 11.29.14.2.

2. Consistently shaped winders, complying with Clause 11.11.5, differing from rectangular treads in the same flight of stairs.

3. Nonuniform riser dimension complying with Clause 11.11.5.4.1.

11.11.5.4.1 Nonuniform height risers.

Where the bottom or top riser adjoins a sloping public way, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 102 mm (4 inches) in height, with the variation in height of the bottom or top riser not to exceed one unit vertical in 12 units horizontal (8-percent slope) of stair width. The nosings or leading edges of treads at such nonuniform height risers shall have a distinctive marking stripe, different from any other nosing marking provided on the stair flight. The distinctive marking stripe shall be visible in descent of the stair and shall have a slip-resistant surface. Marking stripes shall have a width of not less than 25 mm (1 inch) but not more than 51 mm (2 inches).

11.11.5.5 Nosing and riser profile.

Nosings shall have a curvature or bevel of not less than 1.6 mm (1/16 inch) but not more than 14.3 mm (9/16 inch) from the foremost projection of the tread. Risers shall be solid and vertical or sloped under the tread above from the underside of the nosing above at an angle not more than 30 degrees (0.52 rad) from the vertical.

11.11.5.5.1 Nosing projection size.

The leading edge (nosings) of treads shall project not more than 32 mm (11/4 inches) beyond the tread below.

11.11.5.5.2 Nosing projection uniformity.

Nosings projections of the leading edges shall be of uniform size, including the projections of the nosing’s leading edge of the floor at the top of a flight.

11.11.5.5.3 Solid risers.

Risers shall be solid.

Exceptions:

1. Solid risers are not required for stairways that are not required to comply with Clause 11.9.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 102 mm (4 inches).

2. Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas accessible to the public. The size of the opening in the riser is not restricted.

3. Solid risers are not required for spiral stairways constructed in accordance with Clause 11.11.10.

11.11.6 Stairway landings.

There shall be a floor or landing at the top and bottom of each stairway. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of stairways served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the stairway or 1219 mm (48 inches), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 178 mm (7 inches) into a landing. Where wheelchair spaces are required on the stairway landing in accordance with Clause 11.9.6.3, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces.

Exception: Where stairways connect stepped aisles to cross aisles or concourses, stairway landings are not required at the transition between stairways and stepped aisles constructed in accordance with Clause 11.29.
11.11.7 Stairway construction.

Stairways shall be built of materials consistent with the types permitted for the type of construction of the building, except that wood handrails shall be permitted for all types of construction.

11.11.7.1 Stairway walking surface.

The walking surface of treads and landings of a stairway shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. Stairway treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached.

Exceptions:

1. Openings in stair walking surfaces shall be a size that does not permit the passage of 12.7 mm (1/2-inch-diameter) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.

2. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of 29 mm (11/8 inches) cannot pass through the opening.

11.11.7.2 Outdoor conditions.

Outdoor stairways and outdoor approaches to stairways shall be designed so that water will not accumulate on walking surfaces.

11.11.7.3 Enclosures under interior stairways.

The walls and soffits within enclosed usable spaces under enclosed and unenclosed stairways shall be protected by 1-hour fire-resistance-rated construction or the fire-resistance rating of the stairway enclosure, whichever is greater. Access to the enclosed space shall not be directly from within the stairway enclosure.

Exception: Spaces under stairways serving and contained within a single residential dwelling unit in Group R-2 or R-3 shall be permitted to be protected on the enclosed side with 12.7 mm (1/2-inch) gypsum board.

11.11.7.4 Enclosures under exterior stairways.

There shall not be enclosed usable space under exterior exit stairways unless the space is completely enclosed in 1-hour fire-resistance-rated construction. The open space under exterior stairways shall not be used for any purpose.

11.11.8 Vertical rise.

A flight of stairs shall not have a vertical rise greater than 3658 mm (12 feet) between floor levels or landings.

Exception: Spiral stairways used as a means of escape from technical production areas.

11.11.9 Curved stairways.

Curved stairways with winder treads shall have treads and risers in accordance with Clause 11.11.5 and the smallest radius shall be not less than twice the minimum width or required capacity of the stairway.

Exception: The radius restriction shall not apply to curved stairways in Group R-3 and within individual dwelling units in Group R-2.

11.11.10 Spiral stairways.

Spiral stairways are permitted to be used as a component in the means of Escape only within dwelling units or from a space not more than 23 m² (250 square feet) in area and serving not more than five occupants, or from technical production areas in accordance with Clause 4.10.5.

A spiral stairway shall have a 171 mm minimum clear tread depth at a point 305 mm (12 inches) from the narrow edge. The risers shall be sufficient to provide a headroom of 1981 mm (78 inches) minimum, but riser height shall not be more than 241 mm (9 1/2 inches). The minimum stairway clear width at and below the handrail shall be 660 mm (26 inches).
11.11.11 Handrails.

Flights of stairways shall have handrails on each side and shall comply with Clause 11.14. Where glass is used to provide the handrail, the handrail shall comply with Clause 25.7.

Exceptions:

1. Flights of stairways within dwelling units and flights of spiral stairways are permitted to have a handrail on one side only.

2. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.

3. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or Escape door does not require handrails.

4. Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require handrails.

11.11.12 Stairway to roof.

In buildings four or more stories above grade plane, one stairway shall extend to the roof surface unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope).

Exception: Other than where required by Clause 11.11.12.1, in buildings without an occupied roof access to the roof from the top storey shall be permitted to be by an alternating tread device, a ships ladder or a permanent ladder.

11.11.12.1 Stairway to elevator equipment.

Roofs and penthouses containing elevator equipment that must be accessed for maintenance are required to be accessed by a stairway.

11.11.12.2 Roof access.

Where a stairway is provided to a roof, access to the roof shall be provided through a penthouse complying with Clause 16.10.2.

Exception: In buildings without an occupied roof, access to the roof shall be permitted to be a roof hatch or trap door not less than 1.5 m² (16 square feet) in area and having a minimum dimension of 610 mm (2 feet).

11.11.13 Guards.

 Guards shall be provided along stairways and landings where required by Clause 11.15 and shall be constructed in accordance with Clause 11.15. Where the roof hatch opening providing the required access is located within 10 feet (3049 mm) of the roof edge, such roof access or roof edge shall be protected by guards installed in accordance with Clause 11.15.

11.11.14 Alternating tread devices.

Alternating tread devices are limited to an element of a means of Escape in buildings of Groups F, H and S from a mezzanine not more than 23 m² (250 square feet) in area and that serves not more than five occupants; in buildings of Group I-3 from a guard tower, observation station or control room not more than 23 m² (250 square feet) in area and for access to unoccupied roofs. Alternating tread devices used as a means of Escape shall not have a rise greater than 6096 mm (20 feet) between floor levels or landings.

11.11.14.1 Handrails of alternating tread devices.

Handrails shall be provided on both sides of alternating tread devices and shall comply with Clause 11.14.

11.11.14.2 Treads of alternating tread devices.

Alternating tread devices shall have a minimum tread depth of 127 mm (5 inches), a minimum projected tread depth of 216 mm (8½ inches), a minimum tread width of 178 mm (7 inches) and a maximum riser height of 241 mm (9½ inches). The tread depth shall be measured horizontally between the vertical planes of the foremost projections of adjacent treads. The riser height shall be measured vertically between the leading edges of adjacent treads. The riser height and tread depth provided shall result in an angle of ascent from the horizontal of between 50 and 70 degrees (0.87 and 1.22 rad). The initial tread of the device shall begin
at the same elevation as the platform, landing or floor surface.

**Exception:** Alternating tread devices used as an element of a means of Escape in buildings from a mezzanine area not more than 23 $m^2$ (250 square feet) in area that serves not more than five occupants shall have a minimum tread depth of 76 mm (3 inches) with a minimum projected tread depth of 267 mm (101/2 inches). The rise to the next alternating tread surface shall not exceed 203 mm (8 inches).

**11.11.15 Ships ladders.**

Ships ladders are permitted to be used in Group I-3 as a component of a means of escape to and from control rooms or elevated facility observation stations not more than 23 $m^2$ (250 square feet) with not more than three occupants and for access to unoccupied roofs. The minimum clear width at and below the handrails shall be 508 mm (20 inches).

**11.11.15.1 Handrails of ships ladders.**

Handrails shall be provided on both sides of ships ladders.

**11.11.15.2 Treads of ships ladders.**

Ships ladders shall have a minimum tread depth of 127 mm (5 inches). The tread shall be projected such that the total of the tread depth plus the nosing projection is not less than 216 mm (81/2 inches). The maximum riser height shall be 241 mm (91/2 inches).

**11.11.16 Ladders.**

Permanent ladders shall not serve as a part of the means of Escape from occupied spaces within a building. Permanent ladders shall be constructed in accordance with this Code. Permanent ladders shall be permitted to provide access to the following areas:

1. Spaces frequented only by personnel for maintenance, repair or monitoring of equipment.
2. Nonoccupiable spaces accessed only by catwalks, crawl spaces, freight elevators or very narrow passageways.
3. Raised areas used primarily for purposes of security, life safety or fire safety including, but not limited to, observation galleries, prison guard towers, fire towers or lifeguard stands.
4. Elevated levels in Group U not open to the general public.
5. Nonoccupied roofs that are not required to have stairway access in accordance with Clause 11.11.12.1.
6. Where permitted to access equipment and appliances in accordance with this Code.

**11.12 RAMPS**

**11.12.1 Scope.**

The provisions of this Clause shall apply to ramps used as a component of a means of Escape.

**Exceptions:**

1. Ramped aisles within assembly rooms or spaces shall comply with the provisions in Clause 11.29.
2. Curb ramps shall comply with ICC A117.1.
3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Clauses 11.12.3 through 11.12.10 where they are not an accessible route serving accessible parking spaces, other required accessible elements or part of an accessible means of escape.

**11.12.2 Slope.**

Ramps used as part of a means of Escape shall have a running slope not steeper than one unit vertical in 12 units horizontal (8-percent slope). The slope of other pedestrian ramps shall not be steeper than one unit vertical in eight units horizontal (12.5-percent slope).

**11.12.3 Cross slope.**

The slope measured perpendicular to the direction of travel of a ramp shall not be steeper than one unit vertical in 48 units horizontal (2-percent slope).
11.12.4 Vertical rise.
The rise for any ramp run shall be 762 mm (30 inches) maximum.

11.12.5 Minimum dimensions.
The minimum dimensions of means of escape ramps shall comply with Clauses 11.12.5.1 through 11.12.5.3.

11.12.5.1 Width and capacity.
The minimum width and required capacity of a means of escape ramp shall be not less than that required for corridors by Clause 11.20.2. The clear width of a ramp between handrails, if provided, or other permissible projections shall be 914 mm (36 inches) minimum.

11.12.5.2 Headroom.
The minimum headroom in all parts of the means of escape ramp shall be not less than 2032 mm (80 inches) above the finished floor of the ramp run and any intermediate landings. The minimum clearance shall be maintained for the full width of the ramp and landing.

11.12.5.3 Restrictions.
Means of escape ramps shall not reduce in width in the direction of escape travel. Projections into the required ramp and landing width are prohibited. Doors opening onto a landing shall not reduce the clear width to less than 1067 mm (42 inches).

11.12.6 Landings.
Ramps shall have landings at the bottom and top of each ramp, points of turning, entrance, exits and at doors. Landings shall comply with Clauses 11.12.6.1 through 11.12.6.5.

11.12.6.1 Slope.
Landings shall have a slope not steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. Changes in level are not permitted.

11.12.6.2 Width.
The landing width shall be not less than the width of the widest ramp run adjoining the landing.

11.12.6.3 Length.
The landing length shall be 1525 mm (60 inches) minimum.

Exceptions:
1. In Group R-2 and R-3 individual dwelling and sleeping units that are not required to be Accessible units, Type A units or Type B units in accordance with Clause 11.07, landings are permitted to be 914 mm (36 inches) minimum.

2. Where the ramp is not a part of an accessible route, the length of the landing shall not be required to be more than 1220 mm (48 inches) in the direction of travel.

11.12.6.4 Change in direction.
Where changes in direction of travel occur at landings provided between ramp runs, the landing shall be 1524 mm by 1524 mm (60 inches by 60 inches) minimum.

Exception: In Group R-2 and R-3 individual dwelling or sleeping units that are not required to be Accessible units, Type A units or Type B units in accordance with Clause 12.07, landings are permitted to be 914 mm by 914 mm (36 inches by 36 inches) minimum.

11.12.6.5 Doorways.
Where doorways are located adjacent to a ramp landing, maneuvering clearances required by ICC A117.1 are permitted to overlap the required landing area.

11.12.7 Ramp construction.
Ramps shall be built of materials consistent with the types permitted for the type of construction of the building, except that wood handrails shall be permitted for all types of construction.
11.12.7.1 Ramp surface.
The surface of ramps shall be of slip-resistant materials that are securely attached.

11.12.7.2 Outdoor conditions.
Outdoor ramps and outdoor approaches to ramps shall be designed so that water will not accumulate on walking surfaces.

11.12.8 Handrails.
Ramps with a rise greater than 152 mm (6 inches) shall have handrails on both sides. Handrails shall comply with Clause 11.14.

11.12.9 Guards.
Guards shall be provided where required by Clause 11.15 and shall be constructed in accordance with Clause 11.15.

11.12.10 Edge protection.
Edge protection complying with Clause 11.12.10.1 or 11.12.10.2 shall be provided on each side of ramp runs and at each side of ramp landings.

Exceptions:

1. Edge protection is not required on ramps that are not required to have handrails, provided they have flared sides that comply with the ICC A117.1 curb ramp provisions.

2. Edge protection is not required on the sides of ramp landings serving an adjoining ramp run or stairway.

3. Edge protection is not required on the sides of ramp landings having a vertical dropoff of not more than 12.7 mm (1/2 inch) within 254 mm (10 inches) horizontally of the required landing area.

11.12.10.1 Curb, rail, wall or barrier.
A curb, rail, wall or barrier shall be provided to serve as edge protection. A curb shall be not less than 102 mm (4 inches) in height. Barriers shall be constructed so that the barrier prevents the passage of a 102 mm (4-inch-diameter) sphere, where any portion of the sphere is within 102 mm (4 inches) of the floor or ground surface.

11.12.10.2 Extended floor or ground surface.
The floor or ground surface of the ramp run or landing shall extend 305 mm (12 inches) minimum beyond the inside face of a handrail complying with Clause 11.14.

11.13 EXIT SIGNS

11.13.1 Where required.
Exits and exit access doors shall be marked by an approved exit sign readily visible from any direction of escape travel. The path of escape travel to exits and within exits shall be marked by readily visible exit signs to clearly indicate the direction of escape travel in cases where the exit or the path of escape travel is not immediately visible to the occupants. Intervening means of escape doors within exits shall be marked by exit signs. Exit sign placement shall be such that any point in an exit access corridor or exit passageway is within 100 feet (30 480 mm) or the listed viewing distance of the sign, whichever is less, from the nearest visible exit sign.

Exceptions:

1. Exit signs are not required in rooms or areas that require only one exit or exit access.

2. Main exterior exit doors or gates that are obviously and clearly identifiable as exits need not have exit signs where approved by the building official.

3. Exit signs are not required in occupancies in Group U and individual sleeping units or dwelling units in Group R-1, R-2 or R-3.

4. Exit signs are not required in dayrooms, sleeping rooms or dormitories in occupancies in Group I-3.

5. In occupancies in Groups A-4 and A-5, exit signs are not required on the seating side of vomitories or openings into seating areas where exit signs are provided in the concourse that are readily apparent from the vomitories. Escape lighting is provided to identify each vomitory or opening within the seating area in an emergency.
11.13.2 Low-level exit signs in Group R-1.

Where exit signs are required in Group R-1 occupancies by Clause 11.13.1, additional low-level exit signs shall be provided in all areas serving guest rooms in Group R-1 occupancies and shall comply with Clause 11.13.5.

The bottom of the sign shall be not less than 254 mm (10 inches) nor more than 455 mm (18 inches) above the floor level. The sign shall be flush mounted to the door or wall. Where mounted on the wall, the edge of the sign shall be within 102 mm (4 inches) of the door frame on the latch side.

11.13.3 Illumination.

Exit signs shall be internally or externally illuminated.

Exception: Tactile signs required by Clause 11.13.4 need not be provided with illumination.

11.13.4 Raised character and braille exit signs.

A sign stating EXIT in visual characters, raised characters and braille and complying with ICC A117.1 shall be provided adjacent to each door to an area of refuge, providing direct access to a stairway, an exterior area for assisted rescue, an exit stairway or ramp, an exit passageway and the exit discharge.

11.13.5 Internally illuminated exit signs.

Electrically powered, self-luminous and photoluminescent exit signs shall be listed and labeled in accordance with this Code and shall be installed in accordance with the manufacturer’s instructions. Exit signs shall be illuminated at all times.

11.13.6 Externally illuminated exit signs.

Externally illuminated exit signs shall comply with Clauses 11.13.6.1 through 11.13.6.3.

11.13.6.1 Graphics.

Every exit sign and directional exit sign shall have plainly legible letters not less than 152 mm (6 inches) high with the principal strokes of the letters not less than 19.1 mm (3/4 inch) wide. The word “EXIT” shall have letters having a width not less than 51 mm (2 inches) wide, except the letter “I,” and the minimum spacing between letters shall be not less than 9.5 mm (3/8 inch). Signs larger than the minimum established in this Clause shall have letter widths, strokes and spacing in proportion to their height.

The word “EXIT” shall be in high contrast with the background and shall be clearly discernible when the means of exit sign illumination is or is not energized. If a chevron directional indicator is provided as part of the exit sign, the construction shall be such that the direction of the chevron directional indicator cannot be readily changed.

11.13.6.2 Exit sign illumination.

The face of an exit sign illuminated from an external source shall have an intensity of not less than 54 lux (5 footcandles).

11.13.6.3 Power source.

Exit signs shall be illuminated at all times. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with this Code. Group I-2, Condition 2 exit sign illumination shall not be provided by unit equipment batteries only.

Exception: Approved exit sign illumination types that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.

11.14 HANDRAILS

11.14.2 Height.

Handrail height, measured above stair tread nosings, or finish surface of ramp slope, shall be uniform, not less than 864 mm (34 inches) and not more than 965 mm (38 inches). Handrail height of alternating tread devices and ships ladders, measured above tread nosings, shall be uniform, not less than 762 mm (30 inches) and not more than 864 mm (34 inches).

Exceptions:

1. Where handrail fittings or bendings are used to provide continuous transition between flights, the fittings or bendings shall be permitted to exceed the maximum height.

2. In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are associated with a Group R-3 occupancy or associated with individual dwelling units in Group R-2 occupancies; where handrail fittings or bendings are used to provide continuous transition between flights, transition at winder treads, transition from handrail to guard, or where used at the start of a flight, the handrail height at the fittings or bendings shall be permitted to exceed the maximum height.

3. Handrails on top of a guard where permitted along stepped aisles and ramped aisles in accordance with Clause 11.29.16.

11.14.3 Handrail graspalibility.

Required handrails shall comply with Clause 11.14.3.1 or shall provide equivalent graspalibility.

Exception: In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; handrails shall be Type I in accordance with Clause 11.14.3.1, Type II in accordance with Clause 11.14.3.2 or shall provide equivalent graspalibility.
clearance dimension of 38 mm (11/2 inches) shall be permitted to be reduced by 3.2 mm (1/8 inch).

4. Where handrails are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper guards.

5. Handrails serving stepped aisles or ramped aisles are permitted to be discontinuous in accordance with Clause 11.29.16.1.

11.14.5 Fittings.
Handrails shall not rotate within their fittings.

11.14.6 Handrail extensions.
Handrails shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent flight of stairs or ramp run. Where handrails are not continuous between flights, the handrails shall extend horizontally not less than 305 mm (12 inches) beyond the top riser and continue to slope for the depth of one tread beyond the bottom riser. At ramps where handrails are not continuous between runs, the handrails shall extend horizontally above the landing 305 mm (12 inches) minimum beyond the top and bottom of ramp runs. The extensions of handrails shall be in the same direction of the flights of stairs at stairways and the ramp runs at ramps.

Exceptions:

1. Handrails within a dwelling unit that is not required to be accessible need extend only from the top riser to the bottom riser.

2. Handrails serving aisles in rooms or spaces used for assembly purposes are permitted to comply with the handrail extensions in accordance with Clause 11.29.16.

3. Handrails for alternating tread devices and ships ladders are permitted to terminate at a location vertically above the top and bottom risers. Handrails for alternating tread devices are not required to be continuous between flights or to extend beyond the top or bottom risers.

11.14.7 Clearance.
Clear space between a handrail and a wall or other surface shall be not less than 38 mm (11/2 inches). A handrail and a wall or other surface adjacent to the handrail shall be free of any sharp or abrasive elements.

11.14.8 Projections.
On ramps and on ramped aisles that are part of an accessible route, the clear width between handrails shall be 914 mm (36 inches) minimum. Projections into the required width of aisles, stairways and ramps at each side shall not exceed 114 mm (41/2 inches) at or below the handrail height. Projections into the required width shall not be limited above the minimum headroom height required in Clause 11.11.3. Projections due to intermediate handrails shall not constitute a reduction in the escape width. Where a pair of intermediate handrails are provided within the stairway width without a walking surface between the pair of intermediate handrails and the distance between the pair of intermediate handrails is greater than 152 mm (6 inches), the available Escape width shall be reduced by the distance between the closest edges of each such intermediate pair of handrails that is greater than 152 mm (6 inches).

Stairways shall have intermediate handrails located in such a manner that all portions of the stairway minimum width or required capacity are within 762 mm (30 inches) of a handrail. On monumental stairs, handrails shall be located along the most direct path of escape travel.

11.15 GUARDS

11.15.1 General.
Guards shall comply with the provisions of Clauses 11.15.2 through 11.15.7. Operable windows with sills located more than 1829 mm (72 inches) above finished grade or other surface below shall comply with Clause 11.15.8.

11.15.2 Where required.
Guards shall be located along open-sided walking surfaces, including mezzanines, equipment platforms, aisles, stairs, ramps and landings that are located more than 762 mm
(30 inches) measured vertically to the floor or grade below at any point within 914 mm (36 inches) horizontally to the edge of the open side. Guards shall be adequate in strength and attachment in accordance with this Code.

**Exception:** Guards are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including stairs leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, ramps and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.
5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating areas at cross aisles in accordance with Clause 11.29.17.2.

11.15.2.1 Glazing.

Where glass is used to provide a guard or as a portion of the guard system, the guard shall comply with Clause 25.7. Where the glazing provided does not meet the strength and attachment requirements of this Code, complying guards shall be located along glazed sides of open-sided walking surfaces.

11.15.3 Height.

Required guards shall be not less than 1067 mm (42 inches) high, measured vertically as follows:

1. From the adjacent walking surfaces.
2. On stairways and stepped aisles, from the line connecting the leading edges of the tread nosings.
3. On ramps and ramped aisles, from the ramp surface at the guard.

**Exceptions:**

1. For occupancies in Group R-3 not more than three stories above grade in height and within individual dwelling units in occupancies in Group R-2 not more than three stories above grade in height with separate means of Escape, required guards shall be not less than 914 mm (36 inches) in height measured vertically above the adjacent walking surfaces.

2. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, guards on the open sides of stairs shall have a height not less than 864 mm (34 inches) measured vertically from a line connecting the leading edges of the treads.

3. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard serves as a handrail on the open sides of stairs, the top of the guard shall be not less than 864 mm (34 inches) and not more than 965 mm (38 inches) measured vertically from a line connecting the leading edges of the treads.

4. The guard height in assembly seating areas shall comply with Clause 11.29.17 as applicable.

5. Along alternating tread devices and ships ladders, guards where the top rail serves as a handrail shall have height not less than 762 mm (30 inches) and not more than 864 mm (34 inches), measured vertically from the leading edge of the device tread nosing.

6. In Group F occupancies where exit access stairways serve fewer than three stories and such stairways are not open to the public, and where the top of the guard also serves as a handrail, the top of the guard shall be not less than 864 mm (34 inches) and not more than 965 mm (38 inches) measured vertically from a line connecting the leading edges of the treads.
11.15.4 Opening limitations.

Required guards shall not have openings that allow passage of a sphere 102 mm (4 inches) in diameter from the walking surface to the required guard height.

Exceptions:

1. From a height of 914 mm (36 inches) to 1067 mm (42 inches), guards shall not have openings that allow passage of a sphere 111 mm (43/8 inches) in diameter.
2. The triangular openings at the open sides of a stair, formed by the riser, tread and bottom rail shall not allow passage of a sphere 152 mm (6 inches) in diameter.
3. At elevated walking surfaces for access to and use of electrical, mechanical or plumbing systems or equipment, guards shall not have openings that allow passage of a sphere 533 mm (21 inches) in diameter.
4. In areas that are not open to the public within occupancies in Group I-3, F, H or S, and for alternating tread devices and ships ladders, guards shall not have openings that allow passage of a sphere 533 mm (21 inches) in diameter.
5. In assembly seating areas, guards required at the end of aisles in accordance with Clause 11.29.17.4 shall not have openings that allow passage of a sphere 102 mm (4 inches) in diameter up to a height of 660 mm (26 inches). From a height of 660 mm (26 inches) to 1067 mm (42 inches) above the adjacent walking surfaces, guards shall not have openings that allow passage of a sphere 203 mm (8 inches) in diameter.
6. Within individual dwelling units and sleeping units in Group R-2 and R-3 occupancies, guards on the open sides of stairs shall not have openings that allow passage of a sphere 111 mm (43/8 inches) in diameter.

11.15.5 Screen porches.

Porches and decks that are enclosed with insect screening shall be provided with guards where the walking surface is located more than 762 mm (30 inches) above the floor or grade below.

11.15.6 Mechanical equipment, systems and devices.

Guards shall be provided where various components that require service are located within 3048 mm (10 feet) of a roof edge or open side of a walking surface and such edge or open side is located more than 762 mm (30 inches) above the floor, roof or grade below. The guard shall extend not less than 762 mm (30 inches) beyond each end of such components. The guard shall be constructed so as to prevent the passage of a sphere 533 mm (21 inches) in diameter.

Exception: Guards are not required where personal fall arrest anchorage connector devices that comply with this Code are installed.

11.15.7 Roof access.

Guards shall be provided where the roof hatch opening is located within 3048 mm (10 feet) of a roof edge or open side of a walking surface and such edge or open side is located more than 762 mm (30 inches) above the floor, roof or grade below. The guard shall be constructed so as to prevent the passage of a sphere 533 mm (21 inches) in diameter.

Exception: Guards are not required where personal fall arrest anchorage connector devices that comply with this Code are installed.

11.15.8 Window openings.

Windows in Group R-2 and R-3 buildings including dwelling units, where the top of the sill of an operable window opening is located less than 36 inches above the finished floor and more than 1829 mm (72 inches) above the finished grade or other surface below on the exterior of the building, shall comply with one of the following:

1. Operable windows where the top of the sill of the opening is located more
than 22 860 mm (75 feet) above the finished grade or other surface below and that are provided with window fall prevention devices that comply with ASTM F2006.

2. Operable windows where the openings will not allow a 102 mm (4-inch-diameter) sphere to pass through the opening when the window is in its largest opened position.

3. Operable windows where the openings are provided with window fall prevention devices that comply with ASTM F2090.

4. Operable windows that are provided with window opening control devices that comply with Clause 11.15.8.1.

11.15.8.1 Window opening control devices.

Window opening control devices shall comply with ASTM F2090. The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Clause 11.30.2.

11.16 EXIT ACCESS

11.16.1 General.

The exit access shall comply with the applicable provisions of Clauses 11.3 through 11.15. Exit access arrangement shall comply with Clauses 11.16 through 11.21.

11.16.2 Escape through intervening spaces.

Escape through intervening spaces shall comply with this Clause.

1. Exit access through an enclosed elevator lobby is permitted. Access to not less than one of the required exits shall be provided without travel through the enclosed elevator lobbies required by this Code. Where the path of exit access travel passes through an enclosed elevator lobby, the level of protection required for the enclosed elevator lobby is not required to be extended to the exit unless direct access to an exit is required by other Clauses of this Code.

2. Escape from a room or space shall not pass through adjoining or intervening rooms or areas, except where such adjoining rooms or areas and the area served are accessory to one or the other, are not a Group H occupancy and provide a discernible path of Escape travel to an exit.

1. Exception: Means of escape are not prohibited through adjoining or intervening rooms or spaces in a Group H, S or F occupancy where the adjoining or intervening rooms or spaces are the same or a lesser hazard occupancy group.

2. An exit access shall not pass through a room that can be locked to prevent escape.

3. Means of escape from dwelling units or sleeping areas shall not lead through other sleeping areas, toilet rooms or bathrooms.

4. Escape shall not pass through kitchens, storage rooms, closets or spaces used for similar purposes. Exceptions:

1. Means of escape are not prohibited through a kitchen area serving adjoining rooms constituting part of the same dwelling unit or sleeping unit.

2. Means of escape are not prohibited through stockrooms in Group M occupancies where all of the following are met:

2.1. The stock is of the same hazard classification as that found in the main retail area.

2.2. Not more than 50 percent of the exit access is through the stockroom.

2.3. The stockroom is not subject to locking from the escape side.

2.4. There is a demarcated, minimum 1118 mm-wide (44-inch) aisle defined by full- or partial-height fixed walls or similar construction that will
11.16.2.1 Multiple tenants.

Where more than one tenant occupies any one floor of a building or structure, each tenant space, dwelling unit and sleeping unit shall be provided with access to the required exits without passing through adjacent tenant spaces, dwelling units and sleeping units.

Exception: The means of escape from a smaller tenant space shall not be prohibited from passing through a larger adjoining tenant space where such rooms or spaces of the smaller tenant occupy less than 10 percent of the area of the larger tenant space through which they pass; are the same or similar occupancy group; a discernible path of escape travel to an exit is provided; and the means of Escape into the adjoining space is not subject to locking from the escape side. A required means of escape serving the larger tenant space shall not pass through the smaller tenant space or spaces.

11.17 EXIT ACCESS TRAVEL DISTANCE

11.17.1 General.

Travel distance within the exit access portion of the means of escape system shall be in accordance with this Clause.

11.17.2 Limitations.

Exit access travel distance shall not exceed the values given in Table 11.17.2.

**TABLE 11.17.2 EXIT ACCESS TRAVEL DISTANCE**

**Note:** For SI: 1 foot = 304.8 mm.

(a) See the following Clauses for modifications to exit access travel distance requirements:
- Clause 4.2.8: For the distance limitation in malls.
- Clause 4.4.9: For the distance limitation through an atrium space.
- Clause 4.7.4: For the distance limitation in Group I-2.
- Clauses 4.8.6.1 and 408.8.1: For the distance limitations in Group I-3.
- Clause 4.11.3: For the distance limitation in special amusement buildings.
- Clause 4.12.6: For the distance limitations in aircraft manufacturing facilities.
- Clause 11.6.2.2.2: For the distance limitation in refrigeration machinery rooms.
- Clause 11.6.2.2.3: For the distance limitation in refrigerated rooms and spaces.
- Clause 11.6.3.3: For buildings with one exit.
- Clause 11.17.2.2: For increased distance limitation in Groups F-1 and S-1.
- Clause 11.29.7: For increased limitation in assembly seating.
- Clause 32.3.4: For temporary structures.
- Clause 32.4.9: For pedestrian walkways.

(b) Buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2. See Clause 10.3 for occupancies where automatic sprinkler systems are permitted in accordance with Clause 10.3.3.1.2.

(c) Buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

(d) Group H occupancies equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.2.5.1.

(e) Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Clause 10.3.3.1.3.

11.17.2.1 Exterior Escape balcony increase.

Exit access travel distances specified in Table 11.17.2 shall be increased up to an additional 30 480 mm (100 feet) provided that the last portion of the exit access leading to the exit occurs on an exterior Escape balcony constructed in accordance with Clause 11.21. The length of such balcony shall be not less than the amount of the increase taken.

11.17.2.2 Groups F-1 and S-1 increase.

The maximum exit access travel distance shall be 122 m (400 feet) in Group F-1 or S-1 occupancies where all of the following conditions are met:
1. The portion of the building classified as Group F-1 or S-1 is limited to one storey in height.
2. The minimum height from the finished floor to the bottom of the ceiling or roof slab or deck is 7315 mm (24 feet).
3. The building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

11.17.3 Measurement.

Exit access travel distance shall be measured from the most remote point of each room, area or space along the natural and unobstructed path of horizontal and vertical escape travel to the entrance to an exit.

Exception: In open parking garages, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.

11.17.3.1 Exit access stairways and ramps.

Travel distance on exit access stairways or ramps shall be included in the exit access travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stair and landings. The measurement along ramps shall be made on the walking surface in the center of the ramp and landings.

11.18 AISLES

11.18.1 General.

Aisles and aisle accessways serving as a portion of the exit access in the means of Escape system shall comply with the requirements of this Clause. Aisles or aisle accessways shall be provided from all occupied portions of the exit access that contain seats, tables, furnishings, displays and similar fixtures or equipment. The minimum width or required capacity of aisles shall be unobstructed.

Exception: Encroachments complying with Clause 11.5.7.

11.18.2 Aisles in assembly spaces.

Aisles and aisle accessways serving a room or space used for assembly purposes shall comply with Clause 11.29.

11.18.3 Aisles in Groups B and M.

In Group B and M occupancies, the minimum clear aisle width shall be determined by Clause 11.5.1 for the occupant load served, but shall be not less than that required for corridors by Clause 11.20.2.

Exception: Nonpublic aisles serving less than 50 people and not required to be accessible by Part 12 need not exceed 711 mm (28 inches) in width.

11.18.4 Aisle accessways in Group M.

An aisle accessway shall be provided on not less than one side of each element within the merchandise pad. The minimum clear width for an aisle accessway not required to be accessible shall be 762 mm (30 inches). The required clear width of the aisle accessway shall be measured perpendicular to the elements and merchandise within the merchandise pad. The 762 mm (30-inch) minimum clear width shall be maintained to provide a path to an adjacent aisle or aisle accessway. The common path of escape travel shall not exceed 9144 mm (30 feet) from any point in the merchandise pad.

Exception: For areas serving not more than 50 occupants, the common path of escape travel shall not exceed 22860 mm (75 feet).

11.18.5 Aisles in other than assembly spaces and Groups B and M.

In other than rooms or spaces used for assembly purposes and Group B and M occupancies, the minimum clear aisle capacity shall be determined by Clause 11.5.1 for the occupant load served, but the width shall be not less than that required for corridors by Clause 11.20.2.

Exception: Nonpublic aisles serving less than 50 people and not required to be accessible by Part 12 need not exceed 711 mm (28 inches) in width.
11.19 EXIT ACCESS STAIRWAYS AND RAMPS

11.19.1 General.

Exit access stairways and ramps serving as an exit access component in a means of escape system shall comply with the requirements of this Clause. The number of stories connected by exit access stairways and ramps shall include basements, but not mezzanines.

11.19.2 All occupancies.

Exit access stairways and ramps that serve floor levels within a single storey are not required to be enclosed.

11.19.3 Occupancies other than Groups I-2 and I-3.

In other than Group I-2 and I-3 occupancies, floor openings containing exit access stairways or ramps that do not comply with one of the conditions listed in this Clause shall be enclosed with a shaft enclosure constructed in accordance with Clause 8.13.

11.19.4 Group I-2 and I-3 occupancies.

In Group I-2 and I-3 occupancies, floor openings between stories containing exit access stairways or ramps are required to be enclosed with a shaft enclosure constructed in accordance with Clause 8.13.

Exception: In Group I-3 occupancies, exit access stairways or ramps constructed in accordance with Clause 4.8 are not required to be enclosed.

11.20 CORRIDORS

11.20.1 Construction.

Corridors shall be fire-resistance rated in accordance with Table 11.20.1. The corridor walls required to be fire-resistance rated shall comply with Clause 8.8 for fire partitions.

Exceptions:

1. A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has not less than one door opening directly to the exterior and rooms for assembly purposes have not less than one-half of the required means of escape doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.

2. A fire-resistance rating is not required for corridors contained within a dwelling unit or sleeping unit in an occupancy in Groups I-1 and R.

3. A fire-resistance rating is not required for corridors in open parking garages.
4. A fire-resistance rating is not required for corridors in an occupancy in Group B that is a space requiring only a single means of Escape complying with Clause 11.6.2.

5. Corridors adjacent to the exterior walls of buildings shall be permitted to have unprotected openings on unrated exterior walls where unrated walls are permitted by Table 7.2 and unprotected openings are permitted by Table 8.5.8.

**Note:**

a. For requirements for occupancies in Group I-2, see Clauses 4.7.2 and 4.7.3.

b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Clause 4.8.8.

c. Buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2 where allowed.

d. Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.3. See Clause 10.3.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Clause 10.3.3.1.3.

#### 11.20.1.1 Hoistway opening protection.

Elevator hoistway openings shall be protected in accordance with this Code.

#### 11.20.2 Width and capacity.

The required capacity of corridors shall be determined as specified in Clause 11.5.1, but the minimum width shall be not less than that specified in Table 11.20.2.

**Exception:** In Group I-2 occupancies, corridors are not required to have a clear width of 96 inches (2438 mm) in areas where there will not be stretcher or bed movement for access to care or as part of the defend-in-place strategy.

</table>
11.20.3 Obstruction.

The minimum width or required capacity of corridors shall be unobstructed.

Exception: Encroachments complying with Clause 11.5.7.

11.20.4 Dead ends.

Where more than one exit or exit access doorway is required, the exit access shall be arranged such that dead-end corridors do not exceed 6096 mm (20 feet) in length.

Exceptions:

1. In in Group I-3, Condition 2, 3 or 4, occupancies, the dead end in a corridor shall not exceed 15 240 mm (50 feet).

2. In occupancies in Groups B, E, F, I-1, M, R-1, R-2, S and U, where the building is equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1, the length of the dead-end corridors shall not exceed 15 240 mm (50 feet).

3. A dead-end corridor shall not be limited in length where the length of the dead-end corridor is less than 2.5 times the least width of the dead-end corridor.

11.20.5 Air movement in corridors.

Corridors shall not serve as supply, return, exhaust, relief or ventilation air ducts.

Exceptions:

1. Use of a corridor as a source of makeup air for exhaust systems in rooms that open directly onto such corridors, including toilet rooms, bathrooms, dressing rooms, smoking lounges and janitor closets, shall be permitted, provided that each such corridor is directly supplied with outdoor air at a rate greater than the rate of makeup air taken from the corridor.

2. Where located within a dwelling unit, the use of corridors for conveying return air shall not be prohibited.

3. Where located within tenant spaces of 93 m² (1,000 square feet) or less in area, utilization of corridors for conveying return air is permitted.

4. Incidental air movement from pressurized rooms within health care facilities, provided that the corridor is not the primary source of supply or return to the room.

11.20.5.1 Corridor ceiling.

Use of the space between the corridor ceiling and the floor or roof structure above as a return air plenum is permitted for one or more of the following conditions:

1. The corridor is not required to be of fire-resistance-rated construction.

2. The corridor is separated from the plenum by fire-resistance-rated construction.

3. The air-handling system serving the corridor is shut down upon activation of the air-handling unit smoke detectors required by this Code.

4. The air-handling system serving the corridor is shut down upon detection of sprinkler water flow where the building is equipped throughout with an automatic sprinkler system.

5. The space between the corridor ceiling and the floor or roof structure above the corridor is used as a component of an approved engineered smoke control system.

11.20.6 Corridor continuity.

Fire-resistance-rated corridors shall be continuous from the point of entry to an exit, and shall not be interrupted by intervening
rooms. Where the path of escape travel within a fire-resistance-rated corridor to the exit includes travel along unenclosed exit access stairways or ramps, the fire-resistance rating shall be continuous for the length of the stairway or ramp and for the length of the connecting corridor on the adjacent floor leading to the exit.

Exceptions:

1. Foyers, lobbies or reception rooms constructed as required for corridors shall not be construed as intervening rooms.

2. Enclosed elevator lobbies as permitted by Item 1 of Clause 11.16.2 shall not be construed as intervening rooms.

11.21 ESCAPE BALCONIES

11.21.1 General.

Balconies used for escape purposes shall conform to the same requirements as corridors for minimum width, required capacity, headroom, dead ends and projections.

11.21.2 Wall separation.

Exterior escape balconies shall be separated from the interior of the building by walls and opening protectives as required for corridors.

Exception: Separation is not required where the exterior escape balcony is served by not less than two stairways and a dead-end travel condition does not require travel past an unprotected opening to reach a stairway.

11.21.3 Openness.

The long side of an escape balcony shall be not less than 50 percent open, and the open area above the guards shall be so distributed as to minimize the accumulation of smoke or toxic gases.

11.21.4 Location.

Exterior Escape balconies shall have a minimum fire separation distance of 3048 mm (10 feet) measured at right angles from the exterior edge of the escape balcony to the following:

1. Adjacent plot lines.
2. Other portions of the building.
3. Other buildings on the same plot unless the adjacent building exterior walls and openings are protected in accordance with Clause 8.5 based on fire separation distance.

For the purposes of this Clause, other portions of the building shall be treated as separate buildings.

11.22 EXITS

11.22.1 General.

Exits shall comply with Clauses 11.22 through 11.27 and the applicable requirements of Clauses 11.3 through 11.15. An exit shall not be used for any purpose that interferes with its function as a means of escape. Once a given level of exit protection is achieved, such level of protection shall not be reduced until arrival at the exit discharge. Exits shall be continuous from the point of entry into the exit to the exit discharge.

11.22.2 Exterior exit doors.

Buildings or structures used for human occupancy shall have not less than one exterior door that meets the requirements of Clause 11.10.1.1.

11.22.2.1 Detailed requirements.

Exterior exit doors shall comply with the applicable requirements of Clause 11.10.1.1.

11.22.2.2 Arrangement.

Exterior exit doors shall lead directly to the exit discharge or the public way.

11.23 INTERIOR EXIT STAIRWAYS AND RAMPS

11.23.1 General.

Interior exit stairways and ramps serving as an exit component in a means of escape system shall comply with the requirements of this Clause. Interior exit stairways and ramps shall
be enclosed and lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Clause 11.24, except as permitted in Clause 11.28.1. An interior exit stairway or ramp shall not be used for any purpose other than as a means of Escape and a circulation path.

11.23.2 Construction.

Enclosures for interior exit stairways and ramps shall be constructed as fire barriers in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both. Interior exit stairway and ramp enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit stairways or ramps shall include any basements, but not any mezzanines. Interior exit stairways and ramps shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions:

1. Interior exit stairways and ramps in Group I-3 occupancies in accordance with the provisions of Clause 4.8.3.8.
2. Interior exit stairways within an atrium enclosed in accordance with Clause 4.4.6.

11.23.3 Termination.

Interior exit stairways and ramps shall terminate at an exit discharge or a public way.

Exception: A combination of interior exit stairways, interior exit ramps and exit passageways, constructed in accordance with Clauses 11.23.2, 11.23.3.1 and 11.24, respectively, and forming a continuous protected enclosure, shall be permitted to extend an interior exit stairway or ramp to the exit discharge or a public way.

11.23.3.1 Extension.

Where interior exit stairways and ramps are extended to an exit discharge or a public way by an exit passageway, the interior exit stairway and ramp shall be separated from the exit passageway by a fire barrier constructed in accordance with Clause 8.7 or a horizontal assembly constructed in accordance with Clause 8.11, or both. The fire-resistance rating shall be not less than that required for the interior exit stairway and ramp. A fire door assembly complying with Clause 8.16 shall be installed in the fire barrier to provide a means of escape from the interior exit stairway and ramp to the exit passageway. Openings in the fire barrier other than the fire door assembly are prohibited. Penetrations of the fire barrier are prohibited.

Exceptions:

1. Penetrations of the fire barrier in accordance with Clause 11.23.5 shall be permitted.
2. Separation between an interior exit stairway or ramp and the exit passageway extension shall not be required where there are no openings into the exit passageway extension.
3. Separation between an interior exit stairway or ramp and the exit passageway extension shall not be required where the interior exit stairway and the exit passageway extension are pressurized in accordance with Clause 10.9.20.5.

11.23.4 Openings.

Interior exit stairway and ramp opening protectives shall be in accordance with the requirements of Clause 8.16.

Openings in interior exit stairways and ramps other than unprotected exterior openings shall be limited to those required for exit access to the enclosure from normally occupied spaces and for escape from the enclosure.

Elevators shall not open into interior exit stairways and ramps.

11.23.5 Penetrations.

Penetrations into or through interior exit stairways and ramps are prohibited except for the following:

1. Equipment and ductwork necessary for independent ventilation or pressurization.
2. Fire protection systems.
4. Two-way communication systems.

5. Electrical raceway for fire department communication systems.

6. Electrical raceway serving the interior exit stairway and ramp and terminating at a steel box not exceeding 0.010 m² (16 square inches).

Such penetrations shall be protected in accordance with Clause 8.14. There shall not be penetrations or communication openings, whether protected or not, between adjacent interior exit stairways and ramps.

Exception: Membrane penetrations shall be permitted on the outside of the interior exit stairway and ramp. Such penetrations shall be protected in accordance with Clause 8.14.4.2.

11.23.6 Ventilation.

Equipment and ductwork for interior exit stairway and ramp ventilation as permitted by Clause 11.23.5 shall comply with one of the following items:

1. Such equipment and ductwork shall be located exterior to the building and shall be directly connected to the interior exit stairway and ramp by ductwork enclosed in construction as required for shafts.

2. Where such equipment and ductwork is located within the interior exit stairway and ramp, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or such air shall be conveyed through ducts enclosed in construction as required for shafts.

3. Where located within the building, such equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required for shafts.

In each case, openings into the fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by opening protectives in accordance with Clause 8.16 for shaft enclosures.

The interior exit stairway and ramp ventilation systems shall be independent of other building ventilation systems.

11.23.7 Interior exit stairway and ramp exterior walls.

Exterior walls of the interior exit stairway or ramp shall comply with the requirements of Clause 8.5 for exterior walls. Where nonrated walls or unprotected openings enclose the exterior of the stairway or ramps and the walls or openings are exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the building exterior walls within 3048 mm (10 feet) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour. This construction shall extend vertically from the ground to a point 3048 mm (10 feet) above the topmost landing of the stairway or ramp, or to the roof line, whichever is lower.

11.23.8 Discharge identification.

An interior exit stairway and ramp shall not continue below its level of exit discharge unless an approved barrier is provided at the level of exit discharge to prevent persons from unintentionally continuing into levels below. Directional exit signs shall be provided as specified in Clause 11.13.

11.23.9 Stairway identification signs.

A sign shall be provided at each floor landing in an interior exit stairway and ramp connecting more than three stories designating the floor level, the terminus of the top and bottom of the interior exit stairway and ramp and the identification of the stairway or ramp. The signage shall state the storey of and direction to the exit discharge, and the availability of roof access from the interior exit stairway and ramp for the fire department. The sign shall be located 1524 mm (5 feet) above the floor landing in a position that is readily visible when the doors are in the open and closed positions. In addition to the stairway identification sign, a floor-level sign in visual characters, raised characters and braille complying with this Code shall be located at each floor-level landing adjacent to the door leading from the interior
exit stairway and ramp into the corridor to identify the floor level.

11.23.9.1 Signage requirements.

Stairway identification signs shall comply with all of the following requirements:

1. The signs shall be a minimum size of 457 mm (18 inches) by 305 mm (12 inches).

2. The letters designating the identification of the interior exit stairway and ramp shall be not less than 38 mm (1 1/2 inches) in height.

3. The number designating the floor level shall be not less than 5 inches (127 mm) in height and located in the center of the sign.

4. Other lettering and numbers shall be not less than 25 mm (1 inch) in height.

5. Characters and their background shall have a nonglare finish. Characters shall contrast with their background, with either light characters on a dark background or dark characters on a light background.

6. Where signs required by Clause 11.23.9 are installed in the interior exit stairways and ramps of buildings subject to Clause 11.25, the signs shall be made of the same materials as required by Clause 11.25.4.

11.23.10 Elevator lobby identification signs.

At landings in interior exit stairways where two or more doors lead to the floor level, any door with direct access to an enclosed elevator lobby shall be identified by signage located on the door or directly adjacent to the door stating “Elevator Lobby.” Signage shall be in accordance with Clause 11.23.9.1, Items 4, 5 and 6.

11.23.11 Smokeproof enclosures.

Where required by Clause 4.3.5.4, 4.5.7.2 or 4.12.2.2.1, interior exit stairways and ramps shall be smokeproof enclosures in accordance with Clause 10.9.20.

1023.11.1 Termination and extension.

A smokeproof enclosure shall terminate at an exit discharge or a public way. The smokeproof enclosure shall be permitted to be extended by an exit passageway in accordance with Clause 11.23.3. The exit passageway shall be without openings other than the fire door assembly required by Clause 11.23.3.1 and those necessary for Escape from the exit passageway. The exit passageway shall be separated from the remainder of the building by 2-hour fire barriers constructed in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

Exceptions:

1. Openings in the exit passageway serving a smokeproof enclosure are permitted where the exit passageway is protected and pressurized in the same manner as the smokeproof enclosure, and openings are protected as required for access from other floors.

2. The fire barrier separating the smokeproof enclosure from the exit passageway is not required, provided that the exit passageway is protected and pressurized in the same manner as the smokeproof enclosure.

3. A smokeproof enclosure shall be permitted to escape through areas on the level of exit discharge or vestibules as permitted by Clause 11.28.

11.23.11.2 Enclosure access.

Access to the stairway or ramp within a smokeproof enclosure shall be by way of a vestibule or an open exterior balcony.

Exception: Access is not required by way of a vestibule or exterior balcony for stairways and ramps using the pressurization alternative complying with Clause 10.9.20.5.

11.23.12 Standpipes.

Standpipes and Fire hydranthose connections shall be provided where required by Clauses 10.5.3 and 10.5.4.

11.24 EXIT PASSAGEWAYS
11.24.1 Exit passageways.
Exit passageways serving as an exit component in a means of escape system shall comply with the requirements of this Clause. An exit passageway shall not be used for any purpose other than as a means of escape and a circulation path.

1024.2 Width and capacity.
The required capacity of exit passageways shall be determined as specified in Clause 11.5.1 but the minimum width shall be not less than 1118 mm (44 inches), except that exit passageways serving an occupant load of less than 50 shall be not less than 914 mm (36 inches) in width. The minimum width or required capacity of exit passageways shall be unobstructed.

Exception: Encroachments complying with Clause 11.5.7.

11.24.3 Construction.
Exit passageway enclosures shall have walls, floors and ceilings of not less than a 1-hour fire-resistance rating, and not less than that required for any connecting interior exit stairway or ramp. Exit passageways shall be constructed as fire barriers in accordance with Clause 8.7 or horizontal assemblies constructed in accordance with Clause 8.11, or both.

11.24.4 Termination.
Exit passageways on the level of exit discharge shall terminate at an exit discharge. Exit passageways on other levels shall terminate at an exit.

11.24.5 Openings.
Exit passageway opening protectives shall be in accordance with the requirements of Clause 8.16.

Except as permitted in Clause 4.2.8.7, openings in exit passageways other than unprotected exterior openings shall be limited to those necessary for exit access to the exit passageway from normally occupied spaces and for escape from the exit passageway.

Where an interior exit stairway or ramp is extended to an exit discharge or a public way by an exit passageway, the exit passageway shall comply with Clause 11.23.3.1.

Elevators shall not open into an exit passageway.

11.24.6 Penetrations.
Penetrations into or through an exit passageway are prohibited except for the following:

1. Equipment and ductwork necessary for independent pressurization.
2. Fire protection systems.
4. Two-way communication systems.
5. Electrical raceway for fire department communication.
6. Electrical raceway serving the exit passageway and terminating at a steel box not exceeding 0.010 m² (16 square inches).

Such penetrations shall be protected in accordance with Clause 8.14. There shall not be penetrations or communicating openings, whether protected or not, between adjacent exit passageways.

Exception: Membrane penetrations shall be permitted on the outside of the exit passageway. Such penetrations shall be protected in accordance with Clause 8.14.4.2.

11.24.7 Ventilation.
Equipment and ductwork for exit passageway ventilation as permitted by Clause 11.24.6 shall comply with one of the following:

1. The equipment and ductwork shall be located exterior to the building and shall be directly connected to the exit passageway by ductwork enclosed in construction as required for shafts.
2. Where the equipment and ductwork is located within the exit passageway, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or the air shall be conveyed through ducts enclosed in construction as required for shafts.
3. Where located within the building, the equipment and ductwork shall be
separated from the remainder of the building, including other mechanical equipment, with construction as required for shafts.

In each case, openings into the fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by opening protectives in accordance with Clause 8.16 for shaft enclosures.

Exit passageway ventilation systems shall be independent of other building ventilation systems.

11.24.8 Fire Hydrant.

Fire Hydrant and Fire hydrant hose connections shall be provided where required by Clauses 10.5.3 and 10.5.4.

11.25 LUMINOUS ESCAPE PATH MARKINGS

11.25.1 General.

Approved luminous escape path markings delineating the exit path shall be provided in high-rise buildings of Group A, B, E, I-1, M or R-1 occupancies in accordance with this Clause.

Exception: Luminous escape path markings shall not be required on the level of exit discharge in lobbies that serve as part of the exit path in accordance with Clause 11.28.1, Exception 1.

11.25.2 Markings within exit components.

Escape path markings shall be provided in interior exit stairways, interior exit ramps and exit passageways, in accordance with Clauses 11.25.2.1 through 11.25.2.6.

11.25.2.1 Steps.

A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Outlining stripes shall have a minimum horizontal width of 25 mm (1 inch) and a maximum width of 51 mm (2 inches). The leading edge of the stripe shall be placed not more than 12.7 mm (1/2 inch) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than 12.7 mm (1/2 inch) down the vertical face of the step.

Exception: The minimum width of 25 mm (1 inch) shall not apply to outlining stripes listed in accordance with this Code.

11.25.2.2 Landings.

The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps.

11.25.2.3 Handrails.

Handrails and handrail extensions shall be marked with a solid and continuous stripe having a minimum width of 25 mm (1 inch). The stripe shall be placed on the top surface of the handrail for the entire length of the handrail, including extensions and newel post caps. Where handrails or handrail extensions bend or turn corners, the stripe shall not have a gap of more than 102 mm (4 inches).

Exception: The minimum width of 25 mm (1 inch) shall not apply to outlining stripes listed in accordance with this Code.

11.25.2.4 Perimeter demarcation lines.

Stair landings and other floor areas within interior exit stairways, interior exit ramps and exit passageways, with the exception of the sides of steps, shall be provided with solid and continuous demarcation lines on the floor or on the walls or a combination of both. The stripes shall be 25 mm to 51 mm (1 to 2 inches) wide with interruptions not exceeding 102 mm (4 inches).

Exception: The minimum width of 25 mm (1 inch) shall not apply to outlining stripes listed in accordance with this Code.

1025.2.4.1 Floor-mounted demarcation lines.

Perimeter demarcation lines shall be placed within 102 mm (4 inches) of the wall and shall extend to within 51 mm (2 inches) of the markings on the leading edge of landings. The demarcation lines shall continue across the floor in front of all doors.

Exception: Demarcation lines shall not extend in front of exit discharge doors that lead out of
an exit and through which occupants must travel to complete the exit path.

11.25.2.4.2 Wall-mounted demarcation lines.

Perimeter demarcation lines shall be placed on the wall with the bottom edge of the stripe not more than 102 mm (4 inches) above the finished floor. At the top or bottom of the stairs, demarcation lines shall drop vertically to the floor within 51 mm (2 inches) of the step or landing edge. Demarcation lines on walls shall transition vertically to the floor and then extend across the floor where a line on the floor is the only practical method of outlining the path. Where the wall line is broken by a door, demarcation lines on walls shall continue across the face of the door or transition to the floor and extend across the floor in front of such door.

**Exception:** Demarcation lines shall not extend in front of exit discharge doors that lead out of an exit and through which occupants must travel to complete the exit path.

11.25.2.4.3 Transition.

Where a wall-mounted demarcation line transitions to a floor-mounted demarcation line, or vice versa, the wall-mounted demarcation line shall drop vertically to the floor to meet a complimentary extension of the floor-mounted demarcation line, thus forming a continuous marking.

11.25.2.5 Obstacles.

Obstacles at or below 1981 mm (6 feet 6 inches) in height and projecting more than 102 mm (4 inches) into the Escape path shall be outlined with markings not less than 25 mm (1 inch) in width comprised of a pattern of alternating equal bands, of luminous material and black, with the alternating bands not more than 51 mm (2 inches) thick and angled at 45 degrees (0.79 rad). Obstacles shall include, but are not limited to, standpipes, hose cabinets, wall projections and restricted height areas. However, such markings shall not conceal any required information or indicators including but not limited to instructions to occupants for the use of standpipes.

**Exception:** The minimum width of 25 mm (1 inch) shall not apply to markings listed in accordance with this Code.

11.25.2.6 Doors within the exit path.

Doors through which occupants must pass in order to complete the exit path shall be provided with markings complying with Clauses 11.25.2.6.1 through 11.25.2.6.3.

11.25.2.6.1 Emergency exit symbol.

The doors shall be identified by a low-location luminous emergency exit symbol complying with the Ghana Fire Code. The exit symbol shall be not less than 102 mm (4 inches) in height and shall be mounted on the door, centered horizontally, with the top of the symbol not higher than 457 mm (18 inches) above the finished floor.

11.25.2.6.2 Door hardware markings.

Door hardware shall be marked with not less than 406 mm² (16 square inches) of luminous material. This marking shall be located behind, immediately adjacent to, or on the door handle or escutcheon. Where a panic bar is installed, such material shall be not less than 25 mm (1 inch) wide for the entire length of the actuating bar or touchpad.

11.25.2.6.3 Door frame markings.

The top and sides of the door frame shall be marked with a solid and continuous 25 mm to 51 mm (1-inch- to 2-inch-wide) stripe. Where the door molding does not provide sufficient flat surface on which to locate the stripe, the stripe shall be permitted to be located on the wall surrounding the frame.

11.25.3 Uniformity.

Placement and dimensions of markings shall be consistent and uniform throughout the same enclosure.

11.25.4 Self-luminous and photoluminescent.

Luminous escape path markings shall be permitted to be made of any material, including paint, provided that an electrical charge is not required to maintain the required luminance. Such materials shall include, but not be limited to, self-luminous materials and photoluminescent materials. Materials shall comply with either of the following standards:
1. ASTM E2072, except that the charging source shall be 1 footcandle (11 lux) of fluorescent illumination for 60 minutes, and the minimum luminance shall be 30 milicandelas per square meter at 10 minutes and 5 milicandelas per square meter after 90 minutes.

11.25.5 Illumination.

Where photoluminescent exit path markings are installed, they shall be provided with not less than 1 footcandle (11 lux) of illumination for not less than 60 minutes prior to periods when the building is occupied and continuously during occupancy.

11.26 HORIZONTAL EXITS

11.26.1 Horizontal exits.

Horizontal exits serving as an exit in a means of escape system shall comply with the requirements of this Clause. A horizontal exit shall not serve as the only exit from a portion of a building, and where two or more exits are required, not more than one-half of the total number of exits or total exit minimum width or required capacity shall be horizontal exits.

Exceptions:

1. Horizontal exits are permitted to comprise two-thirds of the required exits from any building or floor area for occupancies in Group I-2.

2. Horizontal exits are permitted to comprise 100 percent of the exits required for occupancies in Group I-3. Not less than 0.6 m² (6 square feet) of accessible space per occupant shall be provided on each side of the horizontal exit for the total number of people in adjoining compartments.

11.26.2 Separation.

The separation between buildings or refuge areas connected by a horizontal exit shall be provided by a fire wall complying with Clause 8.6; or by a fire barrier complying with Clause 8.7 or a horizontal assembly complying with Clause 8.11, or both. The minimum fire-resistance rating of the separation shall be 2 hours. Opening protectives in horizontal exits shall also comply with Clause 8.16. Duct and air transfer openings in a fire wall or fire barrier that serves as a horizontal exit shall also comply with Clause 8.17. The horizontal exit separation shall extend vertically through all levels of the building unless floor assemblies have a fire-resistance rating of not less than 2 hours and do not have unprotected openings.

Exception: A fire-resistance rating is not required at horizontal exits between a building area and an above-grade pedestrian walkway constructed in accordance with Clause 32.4, provided that the distance between connected buildings is more than 6096 mm (20 feet).

Horizontal exits constructed as fire barriers shall be continuous from exterior wall to exterior wall so as to divide completely the floor served by the horizontal exit.

11.26.3 Opening protectives.

Fire doors in horizontal exits shall be self-closing or automatic-closing when activated by a smoke detector in accordance with Clause 8.16.2.6.6. Doors, where located in a cross-corridor condition, shall be automatic-closing by activation of a smoke detector installed in accordance with Clause 8.16.2.6.6.

11.26.4 Refuge area.

The refuge area of a horizontal exit shall be a space occupied by the same tenant or a public area and each such refuge area shall be adequate to accommodate the original occupant load of the refuge area plus the occupant load anticipated from the adjoining compartment. The anticipated occupant load from the adjoining compartment shall be based on the capacity of the horizontal exit doors entering the refuge area or the total occupant load of the adjoining compartment, whichever is less.

11.26.4.1 Capacity.

The capacity of the refuge area shall be computed based on a net floor area allowance of 0.2787 m² (3 square feet) for each occupant to be accommodated therein. Where the horizontal exit also forms a smoke compartment, the capacity of the refuge area for Group I-1, I-2 and I-3 occupancies and Group B ambulatory care facilities shall comply with Clauses 4.7.5.3, 4.8.6.2, 4.20.6.1 and 4.22.3.2 as applicable.
11.26.4.2 Number of exits.

The refuge area into which a horizontal exit leads shall be provided with exits adequate to meet the occupant requirements of this part, but not including the added occupant load imposed by persons entering the refuge area through horizontal exits from other areas. Not less than one refuge area exit shall lead directly to the exterior or to an interior exit stairway or ramp.

Exception: The adjoining compartment shall not be required to have a stairway or door leading directly outside, provided that the refuge area into which a horizontal exit leads has stairways or doors leading directly outside and are so arranged that escape shall not require the occupants to return through the compartment from which escape originates.

11.26.5 Standpipes.

Standpipes and Fire hydrant hose connections shall be provided where required by Clauses 10.5.3 and 10.5.4.

11.27 EXTERIOR EXIT STAIRWAYS AND RAMPS

11.27.1 Exterior exit stairways and ramps.

Exterior exit stairways and ramps serving as an element of a required means of escape shall comply with this Clause.

11.27.2 Use in a means of Escape.

Exterior exit stairways shall not be used as an element of a required means of escape for Group I-2 occupancies. For occupancies in other than Group I-2, exterior exit stairways and ramps shall be permitted as an element of a required means of escape for buildings not exceeding six stories above grade plane or that are not high-rise buildings.

11.27.3 Open side.

Exterior exit stairways and ramps serving as an element of a required means of escape shall be open on not less than one side, except for required structural columns, beams, handrails and guards. An open side shall have not less than 3.3 m² (35 square feet) of aggregate open area adjacent to each floor level and the level of each intermediate landing. The required open area shall be located not less than 1067 mm (42 inches) above the adjacent floor or landing level.

1027.4 Side yards.

The open areas adjoining exterior exit stairways or ramps shall be either yards, courts or public ways; the remaining sides are permitted to be enclosed by the exterior walls of the building.

11.27.5 Location.

Exterior exit stairways and ramps shall have a minimum fire separation distance of 3048 mm (10 feet) measured at right angles from the exterior edge of the stairway or ramps, including landings, to:

1. Adjacent plot lines.

2. Other portions of the building.

3. Other buildings on the same plot unless the adjacent building exterior walls and openings are protected in accordance with Clause 8.5 based on fire separation distance.

For the purposes of this Clause, other portions of the building shall be treated as separate buildings.

Exception: Exterior exit stairways and ramps serving individual dwelling units of Group R-3 shall have a minimum fire separation distance of 1525 mm (5 feet).

11.27.6 Exterior exit stairway and ramp protection.

Exterior exit stairways and ramps shall be separated from the interior of the building as required in Clause 11.23.2. Openings shall be limited to those necessary for escape from normally occupied spaces. Where a vertical plane projecting from the edge of an exterior exit stairway or ramp and landings is exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the exterior wall shall be rated in accordance with Clause 11.23.7.

Exceptions:

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are
not more than two stories above grade plane where a level of exit discharge serving such occupancies is the first storey above grade plane.

2. Separation from the interior of the building is not required where the exterior exit stairway or ramp is served by an exterior exit ramp or balcony that connects two remote exterior exit stairways or other approved exits with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 2134 mm (7 feet) above the top of the balcony.

4. Separation from the open-ended corridor of the building is not required for exterior exit stairways or ramps, provided that Items 3.1 through 3.5 are met:

4.1. The building, including open-ended corridors, and stairways and ramps, shall be equipped throughout with an automatic sprinkler system in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2.

4.2. The open-ended corridors comply with Clause 11.20.

4.3. The open-ended corridors are connected on each end to an exterior exit stairway or ramp complying with Clause 11.27.

4.4. The exterior walls and openings adjacent to the exterior exit stairway or ramp comply with Clause 11.23.7.

4.5. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 3.3 m² (35 square feet) or an exterior stairway or ramp shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

5. In Group R-3 occupancies not more than four stories in height, exterior exit stairways and ramps serving individual dwelling units are not required to be separated from the interior of the building where the exterior exit stairway or ramp discharges directly to grade.

11.28 FINAL EXIT

11.28.1 General.

Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide a direct path of escape travel to grade. The exit discharge shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required exits.

Exceptions:

1. Not more than 50 percent of the number and minimum width or required capacity of interior exit stairways and ramps is permitted to escape through areas on the level of discharge provided that all of the following conditions are met:

1.1. Discharge of interior exit stairways and ramps shall be provided with a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable from the point of termination of the enclosure.

1.2. The entire area of the level of exit discharge is separated from areas below by construction conforming to the fire-resistance rating for the enclosure.

1.3. The Escape path from the interior exit stairway and ramp on the level of exit discharge is protected throughout by an approved automatic sprinkler system. Portions of the level of exit discharge with access to the escape path shall be either equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1 or 10.3.3.1.2, or separated from the escape path in accordance with the requirements.
for the enclosure of interior exit stairways or ramps.

1.4. Where a required interior exit stairway or ramp and an exit access stairway or ramp serve the same floor level and terminate at the same level of exit discharge, the termination of the exit access stairway or ramp and the exit discharge door of the interior exit stairway or ramp shall be separated by a distance of not less than 9144 mm (30 feet) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit discharge door from the interior exit stairway or ramp and the last tread of the exit access stairway or termination of slope of the exit access ramp.

2. Not more than 50 percent of the number and minimum width or required capacity of the interior exit stairways and ramps is permitted to escape through a vestibule provided that all of the following conditions are met:

2.1. The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating of the interior exit stairway or ramp enclosure.

2.2. The depth from the exterior of the building is not greater than 3048 mm (10 feet) and the length is not greater than 9144 mm (30 feet).

2.3. The area is separated from the remainder of the level of exit discharge by a fire partition constructed in accordance with Clause 8.8.

Exception: The maximum transmitted temperature rise is not required.

2.4. The area is used only for means of escape and exits directly to the outside.

3. Horizontal exits complying with Clause 11.26 shall not be required to discharge directly to the exterior of the building.

11.28.2 Exit discharge width or capacity.

The minimum width or required capacity of the exit discharge shall be not less than the minimum width or required capacity of the exits being served.

11.28.3 Exit discharge components.

Exit discharge components shall be sufficiently open to the exterior so as to minimize the accumulation of smoke and toxic gases.

1028.4 Escape courts.

Escape courts serving as a portion of the exit discharge in the means of Escape system shall comply with the requirements of Clauses 11.28.4.1 and 11.28.4.2.

11.28.4.1 Width or capacity.

The required capacity of escape courts shall be determined as specified in Clause 11.5.1, but the minimum width shall be not less than 1118 mm (44 inches), except as specified herein. Escape courts serving Group R-3 and U occupancies shall be not less than 914 mm (36 inches) in width. The required capacity and width of Escape courts shall be unobstructed to a height of 2134 mm (7 feet).

The width of the escape court shall be not less than the required capacity.

Exception: Encroachments complying with Clause 11.5.7.

11.28.4.2 Construction and openings.

Where an Escape court serving a building or portion thereof is less than 3048 mm (10 feet) in width, the Escape court walls shall have not less than 1-hour fire-resistance-rated construction for a distance of 3048 mm (10 feet) above the floor of the escape court. Openings within such walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.

Exceptions:

1. Escape courts serving an occupant load of less than 10.
2. Escape courts serving Group R-3.

11.28.5 Access to a public way.
The exit discharge shall provide a direct and unobstructed access to a public way.

Exception: Where access to a public way cannot be provided, a safe dispersal area shall be provided where all of the following are met:

1. The area shall be of a size to accommodate not less than 0.46 m² (5 square feet) for each person.

2. The area shall be located on the same plot not less than 15 240 mm (50 feet) away from the building requiring escape.

3. The area shall be permanently maintained and identified as a safe dispersal area.

4. The area shall be provided with a safe and unobstructed path of travel from the building.

11.29 ASSEMBLY

11.29.1 General.
A room or space used for assembly purposes that contains seats, tables, displays, equipment or other material shall comply with this Clause.

11.29.1.1 Bleachers.
Bleachers, grandstands and folding and telescopic seating, that are not building elements, shall comply with this Code.

11.29.1.1.1 Spaces under grandstands and bleachers.
Spaces under grandstands or bleachers shall be separated by fire barriers complying with Clause 8.7 and horizontal assemblies complying with Clause 8.11 with not less than 1-hour fire-resistance-rated construction.

Exceptions:

1. Ticket booths less than 9.29 m² (100 square feet) in area.

2. Toilet rooms.

3. Other accessory use areas 92.9 m² (1,000 square feet) or less in area and equipped with an automatic sprinkler system in accordance with Clause 10.3.3.1.1.

11.29.2 Assembly main exit.
A building, room or space used for assembly purposes that has an occupant load of greater than 300 and is provided with a main exit, that main exit shall be of sufficient capacity to accommodate not less than one-half of the occupant load, but such capacity shall be not less than the total required capacity of all means of Escape leading to the exit. Where the building is classified as a Group A occupancy, the main exit shall front on not less than one street or an unoccupied space of not less than 3048 mm (10 feet) in width that adjoins a street or public way. In a building, room or space used for assembly purposes where there is not a well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building provided that the total capacity of escape is not less than 100 percent of the required capacity.

11.29.3 Assembly other exits.
In addition to having access to a main exit, each level in a building used for assembly purposes having an occupant load greater than 300 and provided with a main exit, shall be provided with additional means of escape that shall provide an escape capacity for not less than one-half of the total occupant load served by that level and shall comply with Clause 11.7.1. In a building used for assembly purposes where there is not a well-defined main exit or where multiple main exits are provided, exits for each level shall be permitted to be distributed around the perimeter of the building, provided that the total width of escape is not less than 100 percent of the required width.

11.29.4 Foyers and lobbies.
In Group A-1 occupancies, where persons are admitted to the building at times when seats are not available, such persons shall be allowed to wait in a lobby or similar space, provided that such lobby or similar space shall not encroach on the minimum width or required
capacity of the means of escape. Such foyer, if not directly connected to a public street by all the main entrances or exits, shall have a straight and unobstructed corridor or path of travel to every such main entrance or exit.

11.29.5 Interior balcony and gallery means of escape.

For balconies, galleries or press boxes having a seating capacity of 50 or more located in a building, room or space used for assembly purposes, not less than two means of escape shall be provided, with one from each side of every balcony, gallery or press box.

11.29.6 Capacity of aisle for assembly.

The required capacity of aisles shall be not less than that determined in accordance with Clause 11.29.6.1 where smoke-protected assembly seating is not provided, Clause 11.29.6.2 where smoke-protected assembly seating is provided and Clause 11.29.6.3 where open-air assembly seating is provided.

11.29.6.1 Without smoke protection.

The required capacity in mm (inches) of the aisles for assembly seating without smoke protection shall be not less than the occupant load served by the escape element in accordance with all of the following, as applicable:

1. Not less than 7.6 mm (0.3 inch) of aisle capacity for each occupant served shall be provided on stepped aisles having riser heights 178 mm (7 inches) or less and tread depths 279 mm (11 inches) or greater, measured horizontally between tread nosings.

2. Not less than 0.127 mm (0.005 inch) of additional aisle capacity for each occupant shall be provided for each 2.5 mm (0.10 inch) of riser height above 178 mm (7 inches).

3. Where escape requires stepped aisle descent, not less than 1.9 mm (0.075 inch) of additional aisle capacity for each occupant shall be provided on those portions of aisle capacity that do not have a handrail within a horizontal distance of 762 mm (30 inches).

4. Ramped aisles, where slopes are steeper than one unit vertical in 12 units horizontal (8-percent slope), shall have not less than 5.6 mm (0.22 inch) of clear aisle capacity for each occupant served. Level or ramped aisles, where slopes are not steeper than one unit vertical in 12 units horizontal (8-percent slope), shall have not less than 5.1 mm (0.20 inch) of clear aisle capacity for each occupant served.

11.29.6.2 Smoke-protected assembly seating.

The required capacity in inches (mm) of the aisle for smoke-protected assembly seating shall be not less than the occupant load served by the escape element multiplied by the appropriate factor in Table 11.29.6.2. The total number of seats specified shall be those within the space exposed to the same smoke-protected environment. Interpolation is permitted between the specific values shown. A life safety evaluation, complying with the Ghana Fire Code, shall be done for a facility utilizing the reduced width requirements of Table 11.29.6.2 for smoke-protected assembly seating.

Exception: For open-air assembly seating with an occupant load not greater than 18,000, the required capacity in inches (mm) shall be determined using the factors in Clause 11.29.6.3.

452
11.29.6.2.1 Smoke control.

Aisles and aisle accessways serving a smoke-protected assembly seating area shall be provided with a smoke control system complying with Clause 10.9 or natural ventilation designed to maintain the smoke level not less than 1829 mm (6 feet) above the floor of the means of escape.

11.29.6.2.2 Roof height.

A smoke-protected assembly seating area with a roof shall have the lowest portion of the roof deck not less than 4572 mm (15 feet) above the highest aisle or aisle accessway.

Exception: A roof canopy in an outdoor stadium shall be permitted to be less than 4572 mm (15 feet) above the highest aisle or aisle accessway provided that there are no objects less than 2032 mm (80 inches) above the highest aisle or aisle accessway.

11.29.6.3 Automatic sprinklers.

Enclosed areas with walls and ceilings in buildings or structures containing smoke-protected assembly seating shall be protected with an approved automatic sprinkler system in accordance with Clause 10.3.3.1.1.

Exceptions:

1. The floor area used for contests, performances or entertainment provided that the roof construction is more than 15 240 mm (50 feet) above the floor level and the use is restricted to low fire hazard uses.

2. Press boxes and storage facilities less than 93 m² (1,000 square feet) in area.

3. Outdoor seating facilities where seating and the means of escape in the seating area are essentially open to the outside.

11.29.6.3 Open-air assembly seating.

In open-air assembly seating, the required capacity in mm (inches) of aisles shall be not less than the total occupant load served by the escape element multiplied by 2.0 mm (0.08) where Escape is by stepped aisle and multiplied by 1.52 mm (0.06) where escape is by level aisles and ramped aisles.

Exception: The required capacity in inches (mm) of aisles shall be permitted to comply with Clause 11.29.6.2 for the number of seats in the open-air assembly seating where Clause 11.29.6.2 permits less capacity.

11.29.7 Travel distance.

The exit access travel distance shall comply with Clause 11.17. Where aisles are provided for seating, the distance shall be measured along the aisles and aisle accessways without travel over or on the seats.

Exceptions:

1. In facilities with smoke-protected assembly seating, the total exit access travel distance shall be not greater than 122 m (400 feet). That portion of the total permitted travel distance from each seat to the nearest entrance to a vomitory or concourse shall not exceed 60 960 mm (200 feet). The portion of the total permitted travel distance from the entrance to the vomitory or concourse to one of the following shall not exceed 60 960 mm (200 feet):

   1.1. The closest riser of an exit access stairway.
1.2. The closest slope of an exit access ramp.

1.3. An exit.

2. In facilities with open-air assembly seating of Type II, III or IV construction, the total exit access travel distance to one of the following shall not exceed 122 m (400 feet):

2.1. The closest riser of an exit access stairway.

2.2. The closest slope of an exit access ramp.

2.3. An exit.

3. In facilities with open-air assembly seating of Type I or II construction, the total exit access travel distance shall not be limited.

11.29.8 Common path of Escape travel.

The common path of escape travel shall not exceed 9144 mm (30 feet) from any seat to a point where an occupant has a choice of two paths of escape travel to two exits.

Exceptions:

1. For areas serving less than 50 occupants, the common path of escape travel shall not exceed 22.860 mm (75 feet).

2. For smoke-protected or open-air assembly seating, the common path of escape travel shall not exceed 15 240 mm (50 feet).

11.29.8.1 Path through adjacent row.

Where one of the two paths of travel is across the aisle through a row of seats to another aisle, there shall be not more than 24 seats between the two aisles, and the minimum clear width between rows for the row between the two aisles shall be 305 mm (12 inches) plus 15.2 mm (0.6 inch) for each additional seat.

11.29.9 Assembly aisles are required.

Every occupied portion of any building, room or space used for assembly purposes that contains seats, tables, displays, similar fixtures or equipment shall be provided with aisles leading to exits or exit access doorways in accordance with this Clause.

11.29.9.1 Minimum aisle width.

The minimum clear width for aisles shall comply with one of the following:

1. Forty-eight inches (1219 mm) for stepped aisles having seating on both sides.

2. Thirty-six inches (914 mm) for stepped aisles having seating on only one side.

3. Exception: Twenty-three inches (584 mm) between a stepped aisle handrail or guard and seating where a stepped aisle is subdivided by a mid-aisle handrail.

4. Twenty-three inches (584 mm) between a stepped aisle handrail or guard and seating where the stepped aisle serves less than 50 seats.

5. Forty-two inches (1067 mm) for level or ramped aisles having seating on both sides.

Exceptions:

1. Thirty-six inches (914 mm) where the aisle serves less than 50 seats.

2. Thirty inches (762 mm) where the aisle serves less than 15 seats and does not serve as part of an accessible route.

3. Exception: Twenty-three inches (584 mm) where the aisle serves less than 50 seats.

4. Thirty-six inches (914 mm) for level or ramped aisles having seating on only one side.
**Exception:** Thirty inches (762 mm) where the aisle serves fewer than 15 seats and does not serve as part of an accessible route.

11.29.9.2 Aisle catchment area.

The aisle shall provide sufficient capacity for the number of persons accommodated by the catchment area served by the aisle. The catchment area served by an aisle is that portion of the total space served by that Clause of the aisle. In establishing catchment areas, the assumption shall be made that there is a balanced use of all means of escape, with the number of persons in proportion to Escape capacity.

11.29.9.3 Converging aisles.

Where aisles converge to form a single path of escape travel, the required capacity of that path shall be not less than the combined required capacity of the converging aisles.

11.29.9.4 Uniform width and capacity.

Those portions of aisles, where Escape is possible in either of two directions, shall be uniform in minimum width or required capacity.

11.29.9.5 Dead-end aisles.

Each end of an aisle shall be continuous to a cross aisle, foyer, doorway, vomitory, concourse or stairway in accordance with Clause 11.29.9.7 having access to an exit.

**Exceptions:**

1. Dead-end aisles shall be not greater than 6096 mm (20 feet) in length.

2. Dead-end aisles longer than 16 rows are permitted where seats beyond the 16th row dead-end aisle are not more than 24 seats from another aisle, measured along a row of seats having a minimum clear width of 305 mm (12 inches) plus 15.2 mm (0.6 inch) for each additional seat above seven in the row where seats have backrests or beyond 10 where seats are without backrests in the row.

3. For smoke-protected or open-air assembly seating, the dead-end aisle length of vertical aisles shall not exceed a distance of 21 rows.

4. For smoke-protected or open-air assembly seating, a longer dead-end aisle is permitted where seats beyond the 21-row dead-end aisle are not more than 40 seats from another aisle, measured along a row of seats having an aisle accessway with a minimum clear width of 305 mm (12 inches) plus 7.6 mm (0.3 inch) for each additional seat above seven in the row where seats have backrests or beyond 10 where seats are without backrests in the row.

11.29.9.6 Aisle measurement.

The clear width for aisles shall be measured to walls, edges of seating and tread edges except for permitted projections.

**Exception:** The clear width of aisles adjacent to seating at tables shall be permitted to be measured in accordance with Clause 11.29.13.1.

11.29.9.6.1 Assembly aisle obstructions.

There shall not be obstructions in the minimum width or required capacity of aisles.

**Exception:** Handrails are permitted to project into the required width of stepped aisles and ramped aisles in accordance with Clause 11.14.8.

11.29.9.7 Stairways connecting to stepped aisles.

A stairway that connects a stepped aisle to a cross aisle or concourse shall be permitted to comply with the assembly aisle walking surface requirements of Clause 11.29.14. Transitions between stairways and stepped aisles shall comply with Clause 11.29.10.

11.29.9.8 Stairways connecting to vomitories.

A stairway that connects a vomitory to a cross aisle or concourse shall be permitted to comply with the assembly aisle walking surface requirements of Clause 11.29.14. Transitions between stairways and stepped aisles shall comply with Clause 11.29.10.
11.29.10 Transitions.

Transitions between stairways and stepped aisles shall comply with either Clause 11.29.10.1 or 11.29.10.2.

11.29.10.1 Transitions to stairways that maintain stepped aisle riser and tread dimensions.

Stepped aisles, transitions and stairways that maintain the stepped aisle riser and tread dimensions shall comply with Clause 11.29.14 as one exit access component.

11.29.10.2 Transitions to stairways that do not maintain stepped aisle riser and tread dimensions.

Transitions between stairways and stepped aisles having different riser and tread dimensions shall comply with Clauses 11.29.10.2.1 through 11.29.10.3.

11.29.10.2.1 Stairways and stepped aisles in a straight run.

Where stairways and stepped aisles are in a straight run, transitions shall have one of the following:

1. A depth of not less than 559 mm (22 inches) where the treads on the descending side of the transition have greater depth.

2. A depth of not less than 762 mm (30 inches) where the treads on the descending side of the transition have lesser depth.

11.29.10.2.2 Stairways that change direction from stepped aisles.

Transitions where the stairway changes direction from the stepped aisle shall have a minimum depth of 11 inches (280 mm) or the stepped aisle tread depth, whichever is greater, between the stepped aisle and stairway.

11.29.10.3 Transition marking.

A distinctive marking stripe shall be provided at each nosing or leading edge adjacent to the transition. Such stripe shall be not less than 25 mm (1 inch), and not more than 51 mm (2 inches), wide. The edge marking stripe shall be distinctively different from the stepped aisle contrasting marking stripe.

11.29.11 Stepped aisles at vomitories.

Stepped aisles that change direction at vomitories shall comply with Clause 11.29.11.1 Transitions between a stepped aisle above a vomitory and a stepped aisle to the side of a vomitory shall comply with Clause 11.29.11.2.

11.29.11.1 Stepped aisles that change direction at vomitories.

Stepped aisle treads where the stepped aisle changes direction at a vomitory shall have a depth of not less than 280 mm (11 inches) or the stepped aisle tread depth, whichever is greater. The height of a stepped aisle tread above a transition at a vomitory shall comply with Clause 11.29.14.2.2.

11.29.11.2 Stepped aisle transitions at the top of vomitories.

Transitions between the stepped aisle above a vomitory and stepped aisles to the side of a vomitory shall have a depth of not less than 280 mm (11 inches) or the stepped aisle tread depth, whichever is greater.

11.29.12 Construction.

Aisles, stepped aisles and ramped aisles shall be built of materials consistent with the types permitted for the type of construction of the building.

Exception: Wood handrails shall be permitted for all types of construction.

11.29.12.1 Walking surface.

The surface of aisles, stepped aisles and ramped aisles shall be of slip-resistant materials that are securely attached. The surface for stepped aisles shall comply with Clause 11.11.7.1.
11.29.12.2 Outdoor conditions.

Outdoor aisles, stepped aisles and ramped aisles and outdoor approaches to aisles, stepped aisles and ramped aisles shall be designed so that water will not accumulate on the walking surface.

11.29.13 Aisle accessways.

Aisle accessways for seating at tables shall comply with Clause 11.29.13.1. Aisle accessways for seating in rows shall comply with Clause 11.29.13.2.

11.29.13.1 Seating at tables.

Where seating is located at a table or counter and is adjacent to an aisle or aisle accessway, the measurement of required clear width of the aisle or aisle accessway shall be made to a line 483 mm (19 inches) away from and parallel to the edge of the table or counter. The 483 mm (19-inch) distance shall be measured perpendicular to the side of the table or counter. In the case of other side boundaries for aisles or aisle accessways, the clear width shall be measured to walls, edges of seating and tread edges.

Exception: Where tables or counters are served by fixed seats, the width of the aisle or aisle accessway shall be measured from the back of the seat.

11.29.13.1.1 Aisle accessway capacity and width for seating at tables.

Aisle accessways serving arrangements of seating at tables or counters shall comply with the capacity requirements of Clause 11.5.1 but shall not have less than 305 mm (12 inches) of width plus 12.7 mm (1/2 inch) of width for each additional 305 mm (1 foot), or fraction thereof, beyond 3658 mm (12 feet) of aisle accessway length measured from the center of the seat farthest from an aisle.

Exception: Portions of an aisle accessway having a length not exceeding 1829 mm (6 feet) and used by a total of not more than four persons.

11.29.13.2 Clear width of aisle accessways serving seating in rows.

Where seating rows have 14 or fewer seats, the minimum clear aisle accessway width shall be not less than 305 mm (12 inches) measured as the clear horizontal distance from the back of the row ahead and the nearest projection of the row behind. Where chairs have automatic or self-rising seats, the measurement shall be made with seats in the raised position. Where any chair in the row does not have an automatic or self-rising seat, the measurements shall be made with the seat in the down position. For seats with folding tablet arms, row spacing shall be determined with the tablet arm in the used position.

Exception: For seats with folding tablet arms, row spacing is permitted to be determined with the tablet arm in the stored position where the tablet arm when raised manually to vertical position in one motion automatically returns to the stored position by force of gravity.

11.29.13.2.1 Dual access.

For rows of seating served by aisles or doorways at both ends, there shall be not more than 100 seats per row. The minimum clear width of 305 mm (12 inches) between rows shall be increased by 7.6 mm (0.3 inch) for every additional seat beyond 14 seats where seats have backrests or beyond 21 where seats are without backrests. The minimum clear width is not required to exceed 559 mm (22 inches).

Exception: For smoke-protected or open-air assembly seating, the row length limits for a 305 mm (12-inch-wide) aisle accessway, beyond which the aisle accessway minimum clear width shall be increased, are in Table 11.29.13.2.1.
11.29.13.2.2 Single access.

For rows of seating served by an aisle or doorway at only one end of the row, the minimum clear width of 305 mm (12 inches) between rows shall be increased by 15.2 mm (0.6 inch) for every additional seat beyond seven seats where seats have backrests or beyond 10 where seats are without backrests. The minimum clear width is not required to exceed 559 mm (22 inches).

**Exception:** For smoke-protected or open-air assembly seating, the row length limits for a 305 mm (12-inch-wide) aisle accessway, beyond which the aisle accessway minimum clear width shall be increased, are in Table 1029.13.2.1.

### Table 1029.13.2.1

| TOTAL NUMBER OF SEATS IN THE SMOKE-PROTECTED OR OPEN-AIR ASSEMBLY SEATING | MAXIMUM NUMBER OF SEATS PER ROW PERMITTED TO HAVE A MINIMUM 12-INCH CLEAR WIDTH AISLE ACCESSWAY |
|---|---|---|---|
| Aisle or doorway at both ends of row | Aisle or doorway at one end of row only |
| Seats with backrests | Seats without backrests | Seats with backrests | Seats without backrests |
| Less than 4,000 | 14 | 21 | 7 | 10 |
| 4,000 | 15 | 22 | 7 | 10 |
| 7,000 | 16 | 23 | 8 | 11 |
| 10,000 | 17 | 24 | 8 | 11 |
| 13,000 | 18 | 25 | 9 | 12 |
| 16,000 | 19 | 26 | 9 | 12 |
| 19,000 | 20 | 27 | 10 | 13 |
| 22,000 and greater | 21 | 28 | 11 | 14 |

**Note:** For SI: 1 inch = 25.4 mm.

11.29.14 Assembly aisle walking surfaces.

11.29.14.1 Ramped aisles.

Aisles that are sloped more than one unit vertical in 20 units horizontal (5-percent slope) shall be considered to be a ramped aisle. Ramped aisles that serve as part of an accessible route in accordance with Clauses 11.9 and 12.8.2 shall have a maximum slope of one unit vertical in 12 units horizontal (8-percent slope). The slope of other ramped aisles shall not exceed one unit vertical in 8 units horizontal (12.5-percent slope).

11.29.14.1.1 Cross slope.

The slope measured perpendicular to the direction of travel of a ramped aisle shall not be steeper than one unit vertical in 48 units horizontal (2-percent slope).

11.29.14.1.2 Landings.

Ramped aisles shall have landings in accordance with Clauses 11.12.6 through 11.12.6.5. Landings for ramped aisles shall be permitted to overlap required aisles or cross aisles.

11.29.14.1.3 Edge protection.

Ramped aisles shall have edge protection in accordance with Clauses 11.12.10 and 11.12.10.1.

**Exception:** In assembly spaces with fixed seating, edge protection is not required on the sides of ramped aisles where the ramped aisles provide access to the adjacent seating and aisle accessways.

11.29.14.2 Stepped aisles.

Aisles with a slope exceeding one unit vertical in eight units horizontal (12.5-percent slope) shall consist of a series of risers and treads that extends across the full width of aisles and complies with Clauses 11.29.14.2.1 through 11.29.14.2.4.

11.29.14.2.1 Treads.

Tread depths shall be not less than 279 mm (11 inches) and shall have dimensional uniformity.
Exception: The tolerance between adjacent treads shall not exceed 4.8 mm (3/16 inch).

11.29.14.2.2 Risers.
Where the gradient of stepped aisles is to be the same as the gradient of adjoining seating areas, the riser height shall be not less than 102 mm (4 inches) nor more than 203 mm (8 inches) and shall be uniform within each flight.

Exceptions:

1. Riser height nonuniformity shall be limited to the extent necessitated by changes in the gradient of the adjoining seating area to maintain adequate sightlines. Where nonuniformities exceed 4.8 mm (3/16 inch) between adjacent risers, the exact location of such nonuniformities shall be indicated with a distinctive marking stripe on each tread at the nosing or leading edge adjacent to the nonuniform risers. Such stripe shall be not less than 25 mm (1 inch), and not more than 51 mm (2 inches), wide. The edge marking stripe shall be distinctively different from the contrasting marking stripe.

2. Riser heights not exceeding 229 mm (9 inches) shall be permitted where they are necessitated by the slope of the adjacent seating areas to maintain sightlines.

11.29.14.2.2.1 Construction tolerances.
The tolerance between adjacent risers on a stepped aisle that were designed to be equal height shall not exceed 4.8 mm (3/16 inch). Where the stepped aisle is designed in accordance with Exception 1 of Clause 11.29.14.2.2, the stepped aisle shall be constructed so that each riser of unequal height, determined in the direction of descent, is not more than 9.5 mm (3/8 inch) in height different from adjacent risers where stepped aisle treads are less than 560 mm (22 inches) in depth and 19.1 mm (3/4 inch) in height different from adjacent risers where stepped aisle treads are 560 mm (22 inches) or greater in depth.

11.29.14.2.3 Tread contrasting marking stripe.
A contrasting marking stripe shall be provided on each tread at the nosing or leading edge such that the location of each tread is readily apparent when viewed in descent. Such stripe shall be not less than 25 mm (1 inch) and not more than 51 mm (2 inches) wide.

Exception: The contrasting marking stripe is permitted to be omitted where tread surfaces are such that the location of each tread is readily apparent when viewed in descent.

11.29.14.2.4 Nosing and profile.
Nosing and riser profile shall comply with Clauses 11.11.5.5 through 11.11.5.5.3.

11.29.15 Seat stability.
In a building, room or space used for assembly purposes, the seats shall be securely fastened to the floor.

Exceptions:

1. In a building, room or space used for assembly purposes or portions thereof without ramped or tiered floors for seating and with 200 or fewer seats, the seats shall not be required to be fastened to the floor.

2. In a building, room or space used for assembly purposes or portions thereof with seating at tables and without ramped or tiered floors for seating, the seats shall not be required to be fastened to the floor.

3. In a building, room or space used for assembly purposes or portions thereof without ramped or tiered floors for seating and with greater than 200 seats, the seats shall be fastened together in groups of not less than three or the seats shall be securely fastened to the floor.

4. In a building, room or space used for assembly purposes where flexibility of the seating arrangement is an integral part of the design and function of the space and seating is on tiered levels,
not more than 200 seats shall not be required to be fastened to the floor. Plans showing seating, tiers and aisles shall be submitted for approval.

5. Groups of seats within a building, room or space used for assembly purposes separated from other seating by railings, guards, partial height walls or similar barriers with level floors and having not more than 14 seats per group shall not be required to be fastened to the floor.

6. Seats intended for musicians or other performers and separated by railings, guards, partial height walls or similar barriers shall not be required to be fastened to the floor.

11.29.16 Handrails.

Ramped aisles having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and stepped aisles shall be provided with handrails in compliance with Clause 11.14 located either at one or both sides of the aisle or within the aisle width.

Exceptions:

1. Handrails are not required for ramped aisles with seating on both sides.

2. Handrails are not required where, at the side of the aisle, there is a guard with a top surface that complies with the graspability requirements of handrails in accordance with Clause 11.14.3.

3. Handrail extensions are not required at the top and bottom of stepped aisles and ramped aisles to permit crossovers within the aisles.

11.29.16.1 Discontinuous handrails.

Where there is seating on both sides of the aisle, the mid-aisle handrails shall be discontinuous with gaps or breaks at intervals not exceeding five rows to facilitate access to seating and to permit crossing from one side of the aisle to the other. These gaps or breaks shall have a clear width of not less than 559 mm (22 inches) and not greater than 914 mm (36 inches), measured horizontally, and the mid-aisle handrail shall have rounded terminations or bends.

11.29.16.2 Handrail termination.

Handrails located on the side of stepped aisles shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent stepped aisle flight.

11.29.16.3 Mid-aisle termination.

Mid-aisle handrails shall not extend beyond the lowest riser and shall terminate within 381 mm (18 inches), measured horizontally, from the lowest riser. Handrail extensions are not required. Exception: Mid-aisle handrails shall be permitted to extend beyond the lowest riser where the handrail extensions do not obstruct the width of the cross aisle.

11.29.16.4 Rails.

Where mid-aisle handrails are provided in stepped aisles, there shall be an additional rail located approximately 305 mm (12 inches) below the handrail. The rail shall be adequate in strength and attachment in accordance with Clause 17.7.8.1.2.

11.29.17 Assembly guards.

Guards adjacent to seating in a building, room or space used for assembly purposes shall be provided where required by Clause 11.15 and shall be constructed in accordance with Clause 11.15 except where provided in accordance with Clauses 11.29.17.1 through 11.29.17.4. At bleachers, grandstands and folding and telescopic seating, guards must be provided where required by this Code and Clause 11.29.17.1.

11.29.17.1 Perimeter guards.

Perimeter guards shall be provided where the footboards or walking surface of seating facilities are more than 762 mm (30 inches) above the floor or grade below. Where the seatboards are adjacent to the perimeter, guard height shall be 1067 mm (42 inches) high minimum, measured from the seatboard. Where the seats are self-rising, guard height shall be 1067 mm (42 inches) high minimum, measured from the floor surface. Where there is an aisle between the seating and the perimeter, the guard height shall be measured in accordance with Clause 11.15.3.
Exceptions:

1. Guards that impact sightlines shall be permitted to comply with Clause 11.29.17.3.

2. Bleachers, grandstands and folding and telescopic seating shall not be required to have perimeter guards where the seating is located adjacent to a wall and the space between the wall and the seating is less than 102 mm (4 inches).

11.29.17.2 Cross aisles.

Cross aisles located more than 762 mm (30 inches) above the floor or grade below shall have guards in accordance with Clause 11.15.

Where an elevation change of 762 mm (30 inches) or less occurs between a cross aisle and the adjacent floor or grade below, guards not less than 660 mm (26 inches) above the aisle floor shall be provided.

Exception: Where the backs of seats on the front of the cross aisle project 610 mm (24 inches) or more above the adjacent floor of the aisle, a guard need not be provided.

11.29.17.3 Sightline-constrained guard heights.

Unless subject to the requirements of Clause 11.29.17.4, a fascia or railing system in accordance with the guard requirements of Clause 11.15 and having a minimum height of 660 mm (26 inches) shall be provided where the floor or footboard elevation is more than 762 mm (30 inches) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating.

11.29.17.4 Guards at the end of aisles.

A fascia or railing system complying with the guard requirements of Clause 11.15 shall be provided for the full width of the aisle where the foot of the aisle is more than 762 mm (30 inches) above the floor or grade below. The fascia or railing shall be not less than 914 mm (36 inches) high and shall provide not less than 1067 mm (42 inches) measured diagonally between the top of the rail and the nosing of the nearest tread.

11.30 EMERGENCY ESCAPE AND RESCUE

11.30.1 General.

In addition to the means of Escape required by this part, emergency escape and rescue openings shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one exit or access to only one exit as permitted by Tables 11.6.3.3(1) and 11.6.3.3(2).

2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth storey above grade plane shall have not fewer than one exterior emergency escape and rescue opening in accordance with this Clause. Where basements contain one or more sleeping rooms, emergency escape and rescue openings shall be required in each sleeping room, but shall not be required in adjoining areas of the basement. Such openings shall open directly into a public way or to a yard or court that opens to a public way.

Exceptions:

1. Basements with a ceiling height of less than 2032 mm (80 inches) shall not be required to have emergency escape and rescue openings.

2. Emergency escape and rescue openings are not required from basements or sleeping rooms that have an exit door or exit access door that opens directly into a public way or to a yard, court or exterior exit balcony that opens to a public way.

3. Basements without habitable spaces and having not more than 18.6 m² (200 square feet) in floor area shall not be required to have emergency escape and rescue openings.

4. Within individual dwelling and sleeping units in Groups R-2 and R-3, where the building is equipped throughout with an automatic sprinkler system installed in accordance with Clause 10.3.3.1.1, 10.3.3.1.2 or 10.3.3.1.3, sleeping rooms in basements shall not be required to have emergency escape and rescue openings provided
that the basement has one of the following:

4.1. One means of escape and one emergency escape and rescue opening.

4.2. Two means of escape.

11.30.1.1 Operational constraints and opening control devices.

Emergency escape and rescue openings shall be operational from inside the room without the use of keys or tools. Window-opening control devices complying with ASTM F2090 shall be permitted for use on windows serving as a required emergency escape and rescue opening.

11.30.2 Minimum size.

Emergency escape and rescue openings shall have a minimum net clear opening of 0.53 m² (5.7 square feet).

Exception: The minimum net clear opening for grade-floor emergency escape and rescue openings shall be 0.46 m² (5 square feet).

11.30.2.1 Minimum dimensions.

The minimum net clear opening height dimension shall be 610 mm (24 inches). The minimum net clear opening width dimension shall be 508 mm (20 inches). The net clear opening dimensions shall be the result of normal operation of the opening.

11.30.3 Maximum height from floor.

Emergency escape and rescue openings shall have the bottom of the clear opening not greater than 1118 mm (44 inches) measured from the floor.

11.30.4 Window wells.

An emergency escape and rescue opening with a finished sill height below the adjacent ground level shall be provided with a window well in accordance with Clauses 11.30.4.1 and 11.30.4.2.

11.30.4.1 Minimum size.

The minimum horizontal area of the window well shall be 0.84 m² (9 square feet), with a minimum dimension of 914 mm (36 inches). The area of the window well shall allow the emergency escape and rescue opening to be fully opened.

11.30.4.2 Ladders or steps.

Window wells with a vertical depth of more than 1118 mm (44 inches) shall be equipped with an approved permanently affixed ladder or steps. Ladders or rungs shall have an inside width of not less than 305 mm (12 inches), shall project not less than 76 mm (3 inches) from the wall and shall be spaced not more than 457 mm (18 inches) on center (o.c.) vertically for the full height of the window well. The ladder or steps shall not encroach into the required dimensions of the window well by more than 152 mm (6 inches). The ladder or steps shall not be obstructed by the emergency escape and rescue opening. Ladders or steps required by this Clause are exempt from the stairway requirements of Clause 11.11.

11.30.5 Bars, grilles, covers and screens.

Bars, grilles, covers, screens or similar devices are permitted to be placed over emergency escape and rescue openings, bulkhead enclosures or window wells that serve such openings, provided that the minimum net clear opening size complies with Clauses 11.30.1.1 through 11.30.4.2 and such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the emergency escape and rescue opening. Where such bars, grilles, covers, screens or similar devices are installed in existing buildings, they shall not reduce the net clear opening of the emergency escape and rescue opening and smoke alarms shall be installed in accordance with Clause 10.7.2.10 regardless of the valuation of the alteration.
PART 12: ACCESSIBILITY

The provisions of this part are contained in the Ghana Accessibility standard GS 1119:2016.
PART 13: INTERIOR ENVIRONMENT

User note:
About this part: Part 13 provides minimum provisions for the interior of buildings—the occupied environment. Ventilation, lighting, and space heating are directly regulated in this part. Minimum room size and maximum room-to-room sound transmission are set for certain occupancies.

13.1 GENERAL

13.1.1 Scope.
The provisions of this part shall govern ventilation, temperature control, lighting, yards and courts, sound transmission, room dimensions, surrounding materials and rodentproofing associated with the interior spaces of buildings.

13.1.2 Indoor air quality management plan required.
An indoor air quality management plan shall be developed. Such plan shall address the methods and procedures to be used during design and construction to obtain compliance with Clauses 13.2 through 13.5.

13.2 BUILDING CONSTRUCTION FEATURES, OPERATIONS AND MAINTENANCE FACILITATION

13.2.1 Scope.
To facilitate the operation and maintenance of the completed building, the building and its systems shall comply with the requirements of Clauses 13.2.2 and 13.2.3.

13.2.2 Air-handling system access.
The arrangement and location of air-handling system components including, but not limited to, ducts, air handler units, fans, coils and condensate pans, shall allow access for cleaning and repair of the air-handling surfaces of such components. Access ports shall be installed in the air-handling system to permit such cleaning and repairs. Piping, conduits, and other building components shall not be located so as to obstruct the required access ports.

13.2.3 Air-handling filtration and bypass pathways.
Air-handling equipment and HVAC equipment shall be designed and installed to limit the amount of airflow that bypasses the air filters and shall comply with the following:

1. Channels, racks and other filter-retaining constructions that do not seal tightly to the filter frame by means of a friction fit shall be provided with a means to seal the filter frame to the filter-retaining construction.
